

OpenWrt/LEDE: when two become one

Florian Fainelli

About Florian

- 2004: Bought a Linksys WRT54G
- 2006: Became an OpenWrt developer
- 2013: Joined Broadcom to work on Set-top Box and Cable Modem Linux kernel, toolchain, bootloader, root filesystem
- 2016: Joined the LEDE team...
- ... while remaining in OpenWrt

Summary

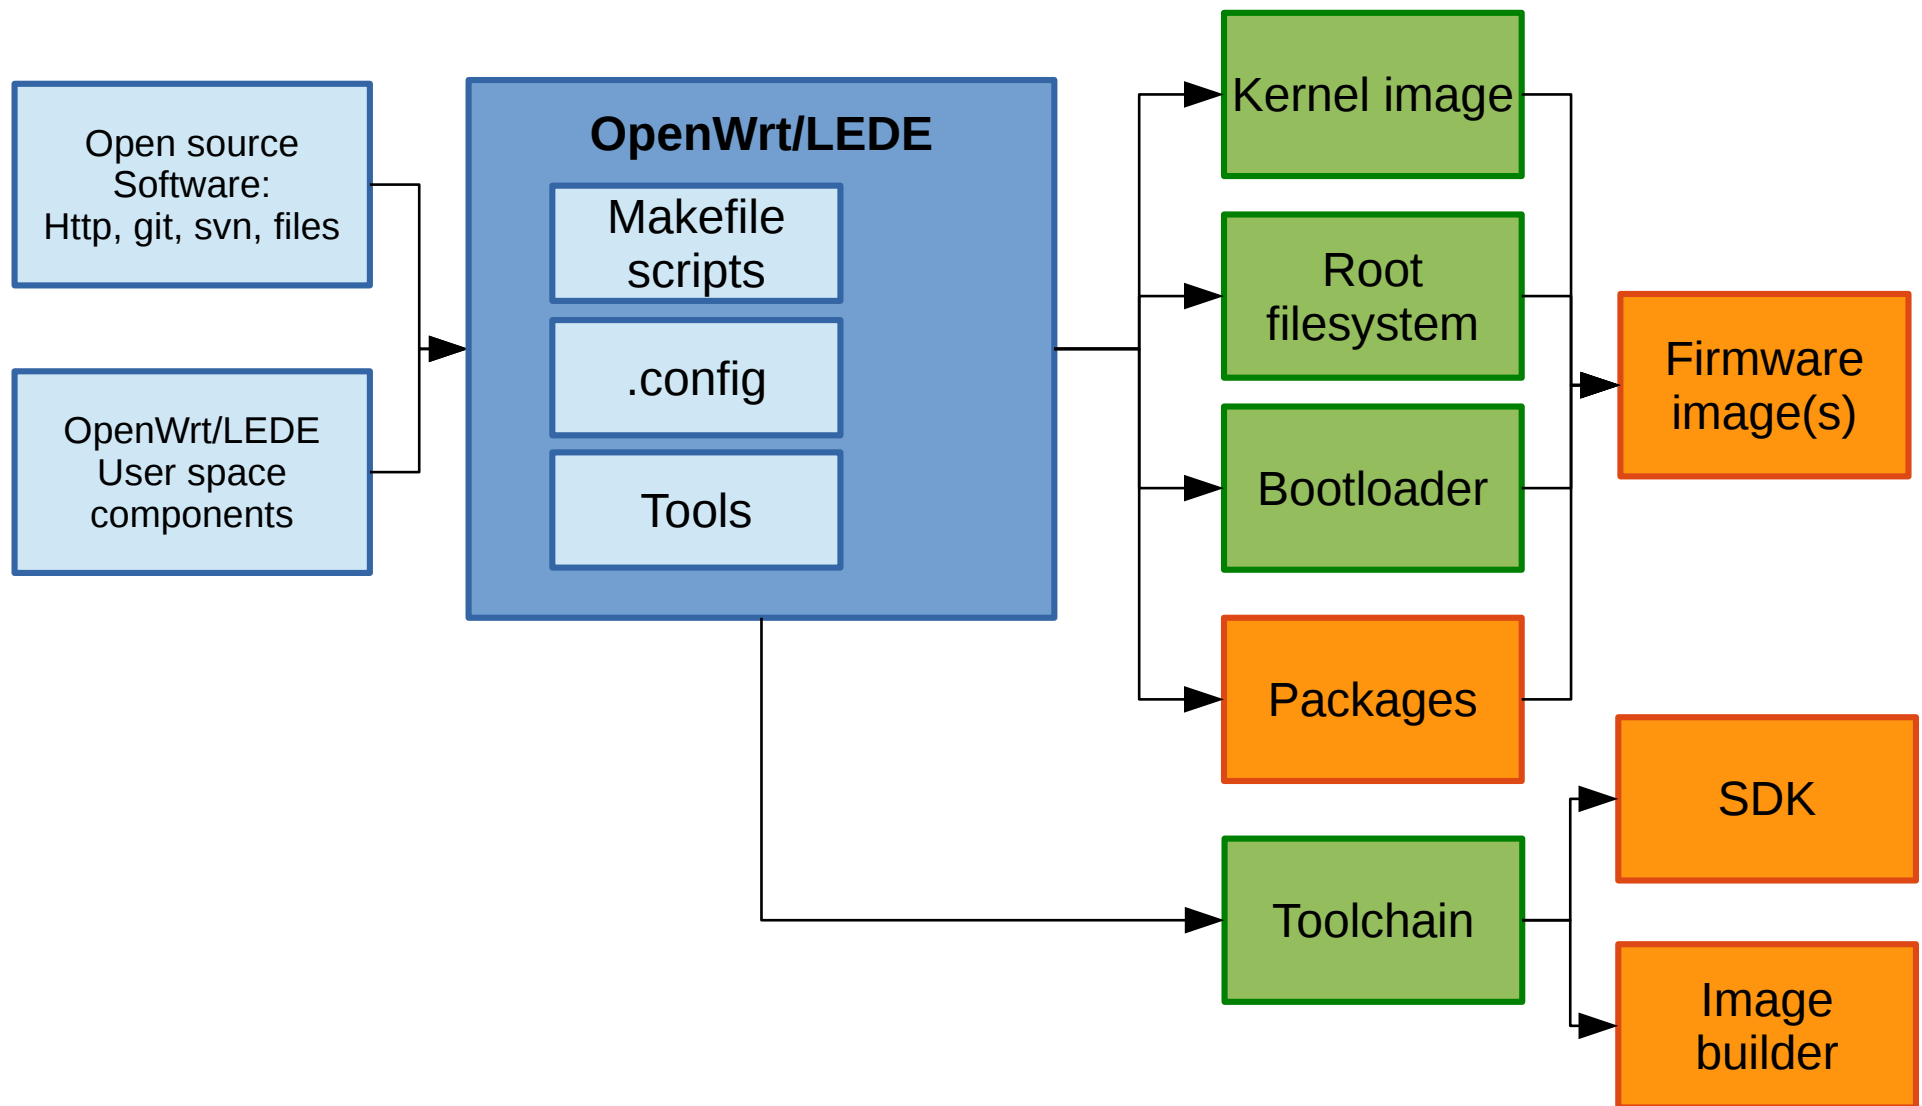

- Introduction to OpenWrt and LEDE
- Design, features and examples
- OpenWrt/LEDE reunification status

Introduction to OpenWrt/LEDE

What are OpenWrt and LEDE?

- Build systems
- Linux distributions
- Communities:
 - Wiki, forums, mailing-lists and git repositories
 - Users, contributors, developers

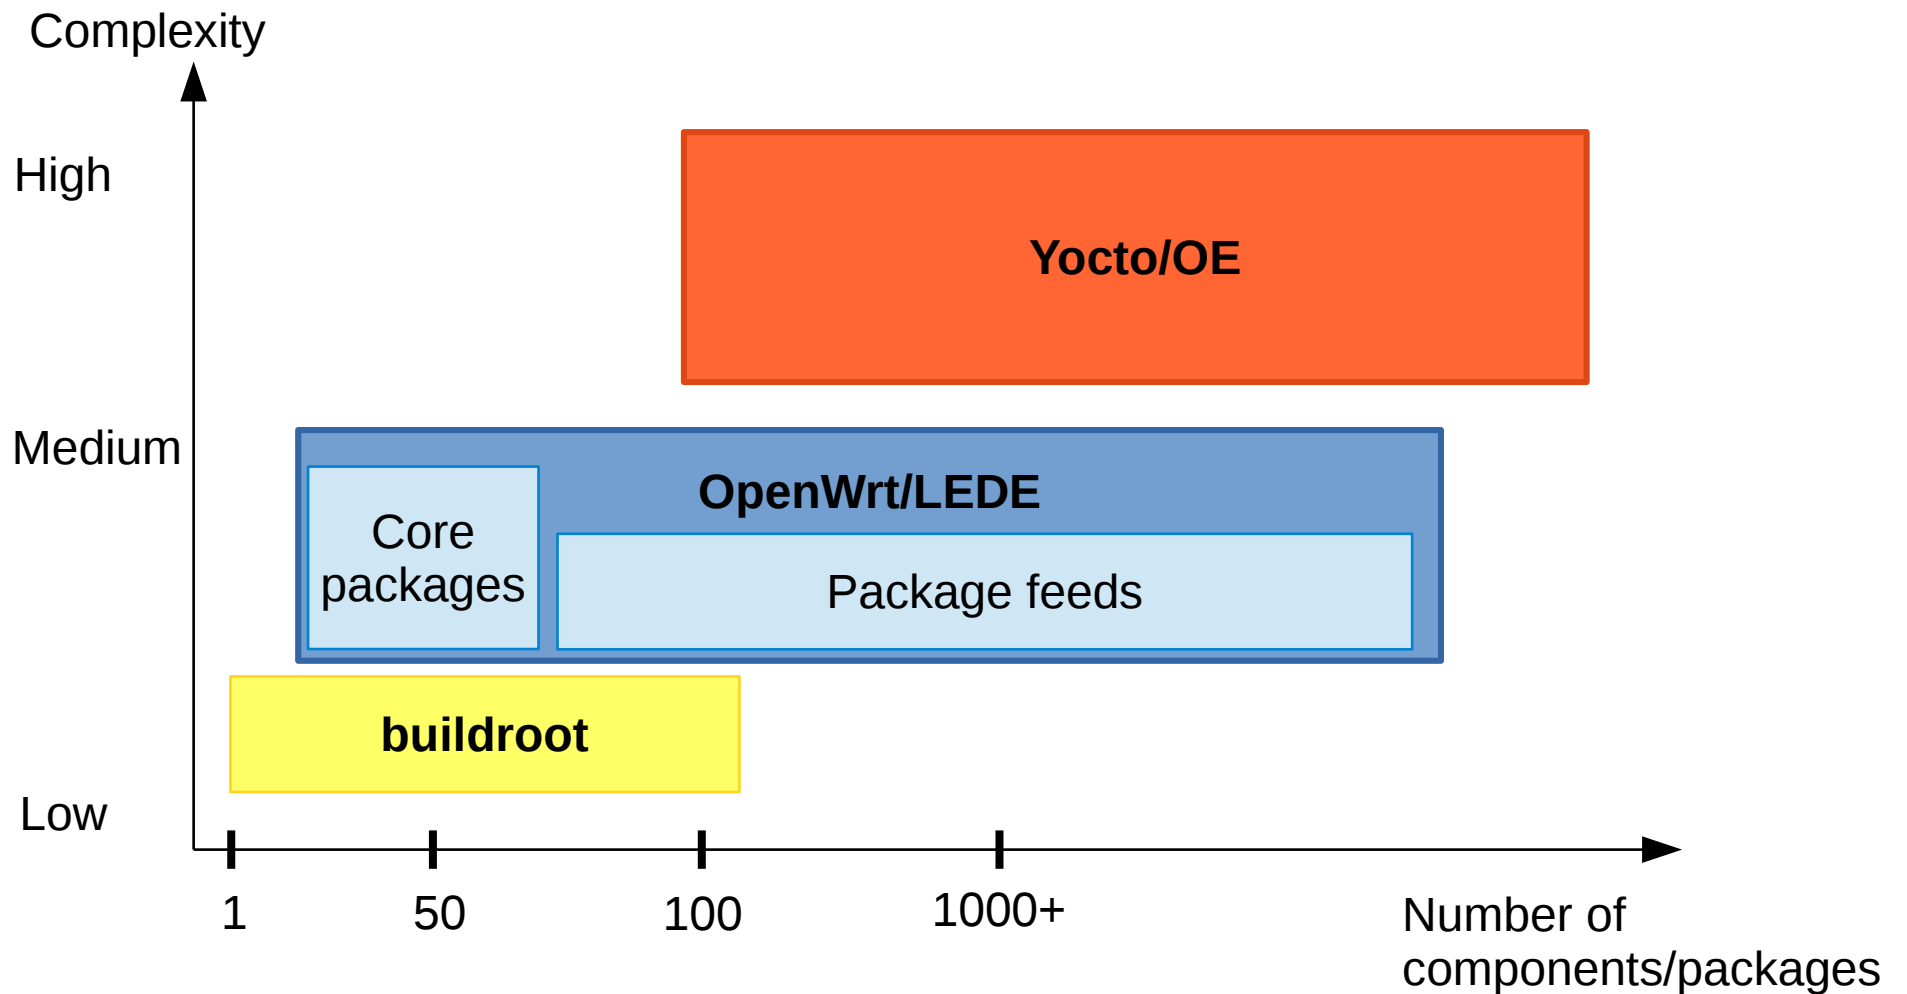

OpenWrt and LEDE in a nutshell

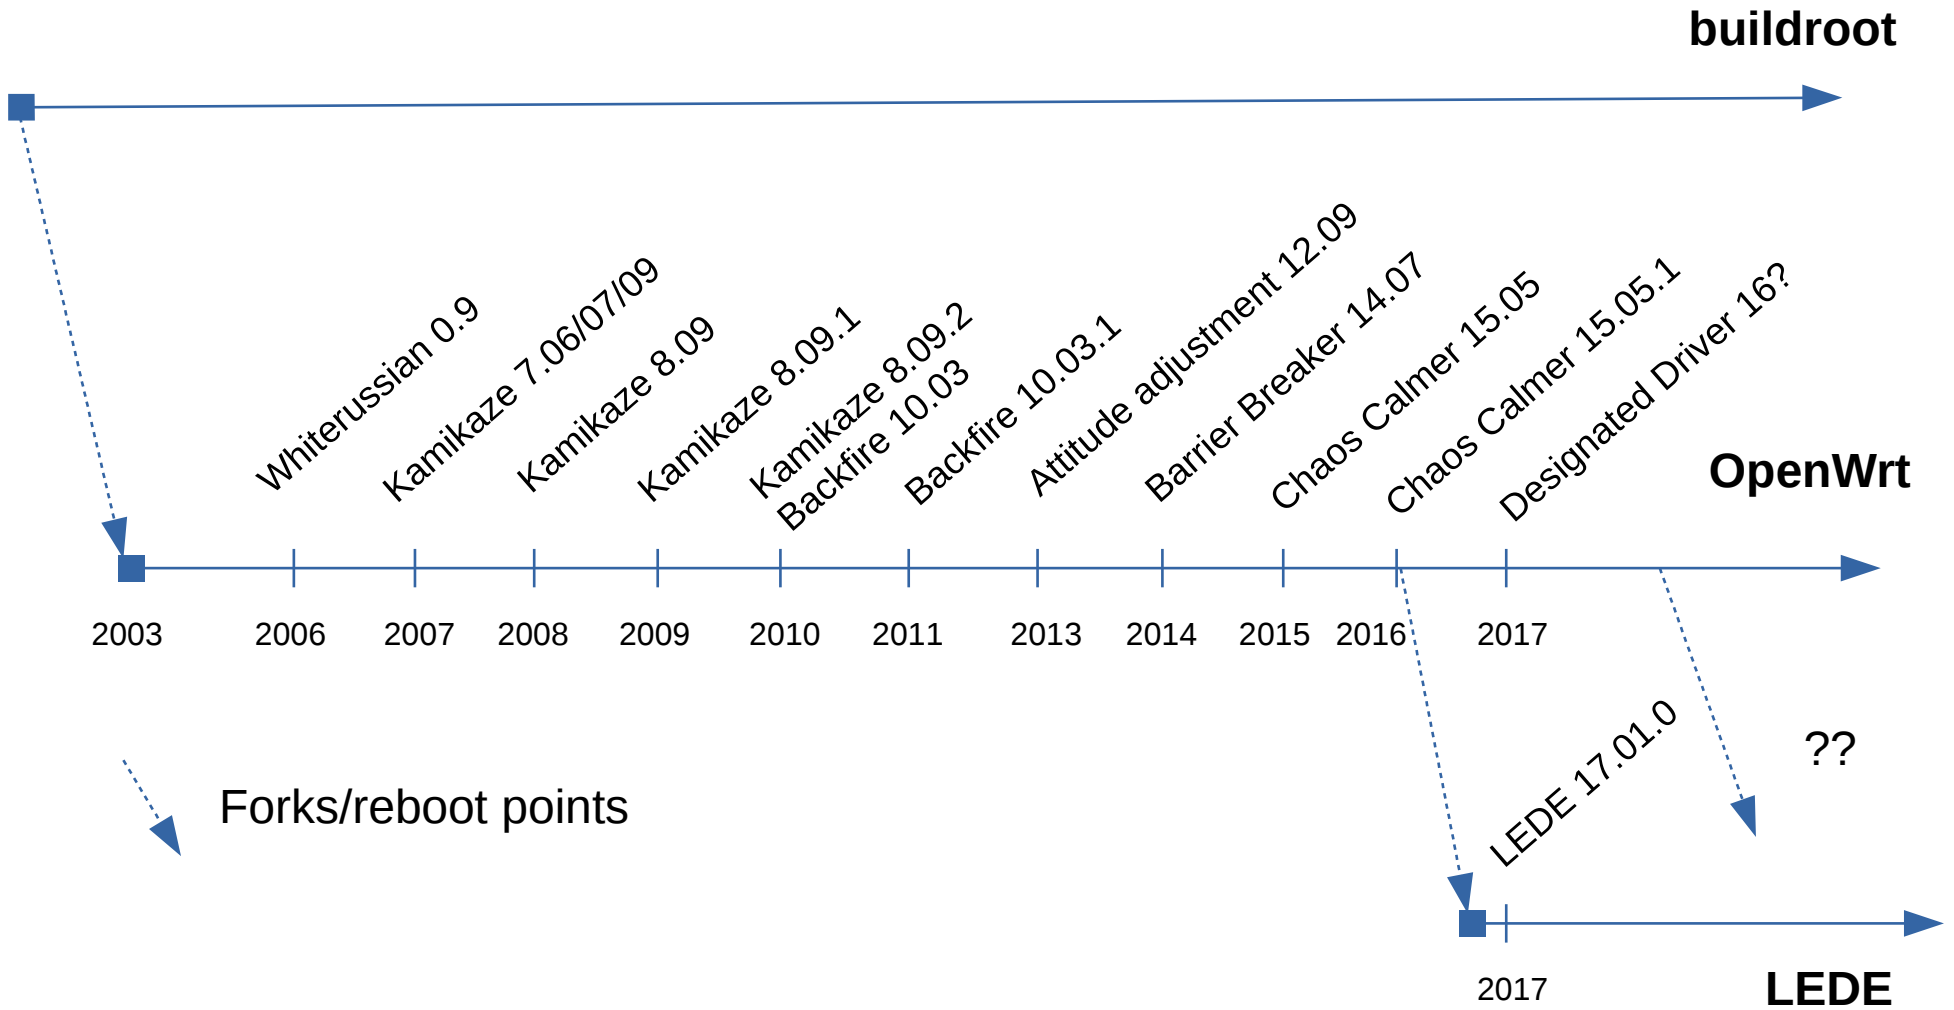

Design goals

- Maintainability
 - Working with latest technologies
 - Frequent updates to solve security flaws
- Ubiquity
 - Most off the shelf routers supported within weeks/months following public availability
 - With LEDE: extend scope beyond traditional network devices
 - Work with vendors to support OpenWrt/LEDE natively
- User empowerment
 - It's open source!
 - Superior quality and control over vendor provided firmware
- Selected differentiation
 - Provide a state of the art network device experience
 - Turn-key solution to build real products

OpenWrt/LEDE in the landscape

Time line

A word or two about router security

- Home routers are a great attack targets
 - Use vendor SDKs, old software, with custom NIH software
 - Millions of vulnerable devices out there running Linux

Design, features and examples

Build system

- Written in GNU Makefile
- Produces *.ipk files for software packages and kernel modules
- Abstracts autotools, cmake, bare-Makefile, libtool
- Make menuconfig based user interface
- Dependencies resolution and configuration validation
- Partial rebuild of everything (packages, toolchain, kernel)
- Supports building for different targets within the same source tree
- Parallel whenever possible

Why not use buildroot or Yocto?

- Buildroot
 - Does not support packages
 - But was a great basis to work from!
- Yocto/OE
 - Too slow, too complex

Menuconfig based interface

.config - LEDE Configuration

LEDE Configuration

Arrow keys navigate the menu. <Enter> selects submenus ---> (or empty submenu ----). Highlighted letters are hotkeys. Pressing <Y> includes, <N> excludes, <M> modularizes features. Press <Esc><Esc> to exit, <?> for Help, </> for Search. Legend: [*] built-in
[] excluded <M> module < > module capable

```
Target System (Broadcom BCM63xx) --->
  Subtarget (generic) --->
  Target Profile (Default Profile) --->
  Target Images --->
  Global build settings --->
  [ ] Advanced configuration options (for developers) (NEW) ----
  [ ] Build the LEDE Image Builder (NEW)
  [ ] Build the LEDE SDK (NEW)
  [ ] Package the LEDE-based Toolchain (NEW)
  [ ] Image configuration (NEW) --->
    Base system --->
    Boot Loaders ----
    Development --->
    Firmware --->
    Kernel modules --->
    Languages --->
    Libraries --->
    Network --->
    Utilities --->
```

Toolchain & kernel

- Toolchain
 - Internal build (default)
 - External (crosstool-ng, custom...)
 - Supports glibc, uClibc-ng and musl-libc
- Kernel
 - Vanilla kernel + OpenWrt/LEDE patches + platform specific patches
 - External kernel: directory or git repository

Package makefile

```
include $(TOPDIR)/rules.mk
```

```
PKG_NAME:=jsonfilter  
PKG_RELEASE:=1
```

```
PKG_SOURCE_PROTO:=git  
PKG_SOURCE_URL=$(LEDE_GIT)/project/jsonpath.git  
PKG_SOURCE_DATE:=2016-07-02  
PKG_SOURCE_VERSION:=dea067ad67d977c247c300c06676a06adf21e0c7  
PKG_MIRROR_HASH:=6c0e30da3f0c82527f9b5285d7c6ae61406732f2b0543b93131fe115ffc2987a  
CMAKE_INSTALL:=1
```

```
PKG_MAINTAINER:=Jo-Philipp Wich <jo@mein.io>  
PKG_LICENSE:=ISC
```

```
include $(INCLUDE_DIR)/package.mk  
include $(INCLUDE_DIR)/cmake.mk
```

```
define Package/jsonfilter  
SECTION:=base  
CATEGORY:=Base system  
DEPENDS:=+libubox +libjson-c  
TITLE:=OpenWrt JSON filter utility  
URL:=http://git.openwrt.org/?p=project/jsonpath.git  
endef
```

```
define Package/jsonfilter/install  
$(INSTALL_DIR) $(1)/usr/bin  
$(INSTALL_BIN) $(PKG_INSTALL_DIR)/usr/bin/jsonpath $(1)/usr/bin/jsonfilter  
endef
```

```
$(eval $(call BuildPackage,jsonfilter))
```

- Define name, revision
- Git URL, git commit, date
- Distribution metadata
- Include cmake macros
- Define package metadata (dependencies, location in menuconfig)
- How to create the package
- Add to the build system

Example work flow

- Clean, build and install jsonfilter into rootfs:

```
make package/jsonfilter/{clean,compile,install}
```

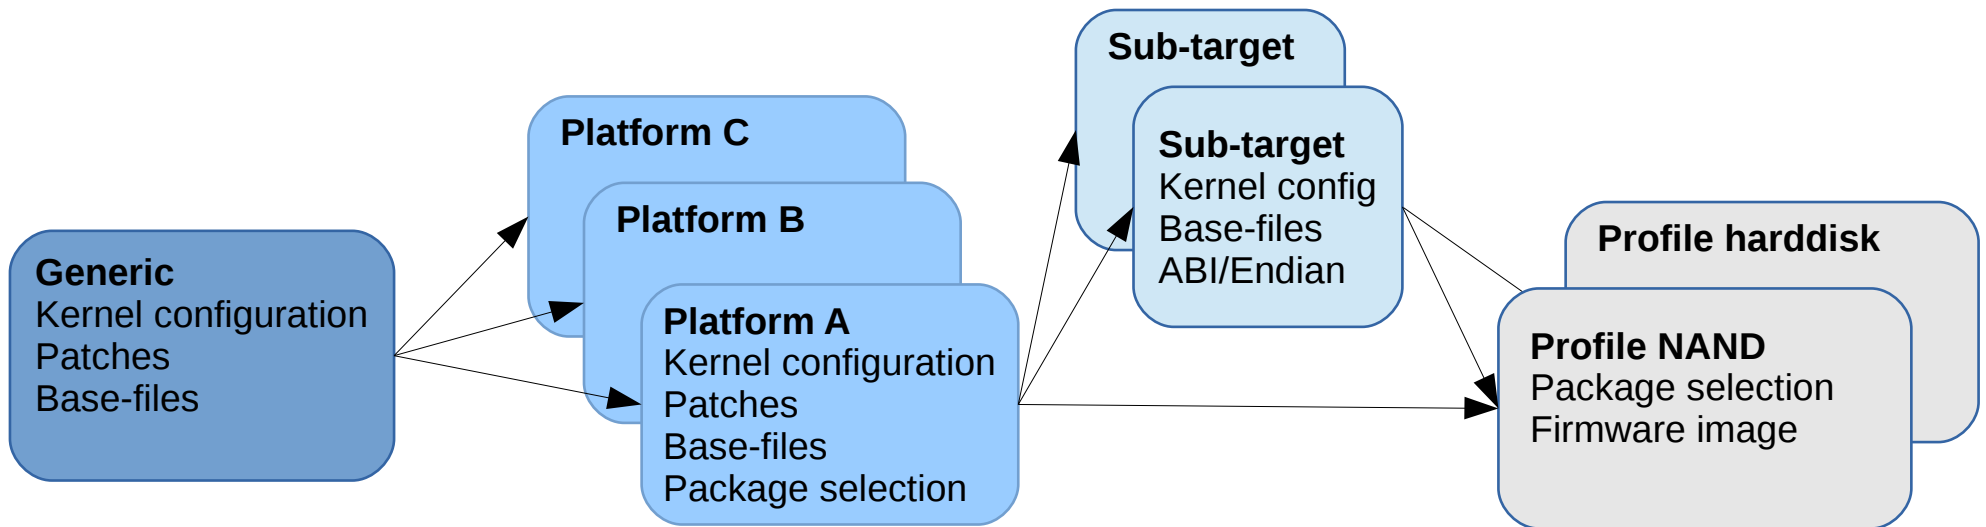

- Force ethtool selection and download sources:

```
CONFIG_PACKAGE_ethtool=m make  
package/ethtool/download
```

- Manage package patches with quilt:

```
make package/ethtool/prepare QUILT=1  
cd build_dir/*/*/ethtool-*/  
quilt push/pop/delete/add
```

Platform layer

Platform definition

```
include $(TOPDIR)/rules.mk
```

- Include macros

```
ARCH:=arm  
BOARD:=realview  
BOARDNAME:=ARM Ltd. Realview board (qemu)  
FEATURES:=fpu ramdisk  
CPU_TYPE:=mpcore  
CPU_SUBTYPE:=vfp
```

- Define architecture
 - Features
 - CPU type (ABI, family)

```
KERNEL_PATCHVER:=3.18
```

- Kernel version

```
DEVICE_TYPE:=developerboard
```

- Default package selection

```
include $(INCLUDE_DIR)/target.mk
```

```
define Target/Description  
Build images for ARM Ltd. Realview boards to be run with qemu  
endef
```

- Distribution (menuconfig) presentation

```
KERNELNAME:=zImage
```

- Indicate what kernel image(s) to build

```
$(eval $(call BuildTarget))
```

- Add to build system

Kernel example work flow

- Build kernel modules

```
make target/linux/compile
```

- Build kernel image and firmware

```
make target/linux/install
```

- Manage kernel patches with quilt

```
make target/linux/prepare QUILT=1  
cd build_dir/target*/linux*/linux-x.y/  
quilt push/pop/add/delete
```

- Switching between environments

```
./scripts/env/new arm-platform  
./scripts/env/switch arm-platform  
make -j42  
./scripts/env/switch mips-platform
```

Even kernel modules are packages!

```
define KernelPackage/tg3
```

```
  TITLE:=Broadcom Tigon3 Gigabit Ethernet
```

```
  KCONFIG:=CONFIG_TIGON3
```

```
  DEPENDS:=+!TARGET_brcm47xx:kmod-libphy  
+kmod-hwmon-core +kmod-ptp
```

```
  SUBMENU:=$(NETWORK_DEVICES_MENU)
```

```
  FILES:=$  
(LINUX_DIR)/drivers/net/ethernet/broadcom/tg3  
.ko
```

```
  AUTOLOAD:=$(call AutoLoad,19,tg3,1)
```

```
endef
```

```
define KernelPackage/tg3/description
```

```
Kernel modules for Broadcom Tigon3 Gigabit  
Ethernet adapters
```

```
endef
```

```
$(eval $(call KernelPackage,tg3))
```

- Kernel package name
- Kconfig option to enable
- Dependencies
- File to install
- Insmod loading hints

- Add to build system

Feeds

- Locations to package recipes

```
src-git packages https://git.lede-project.org/feed/packages.git
```

```
src-link custom /usr/src/openwrt/custom-feed
```

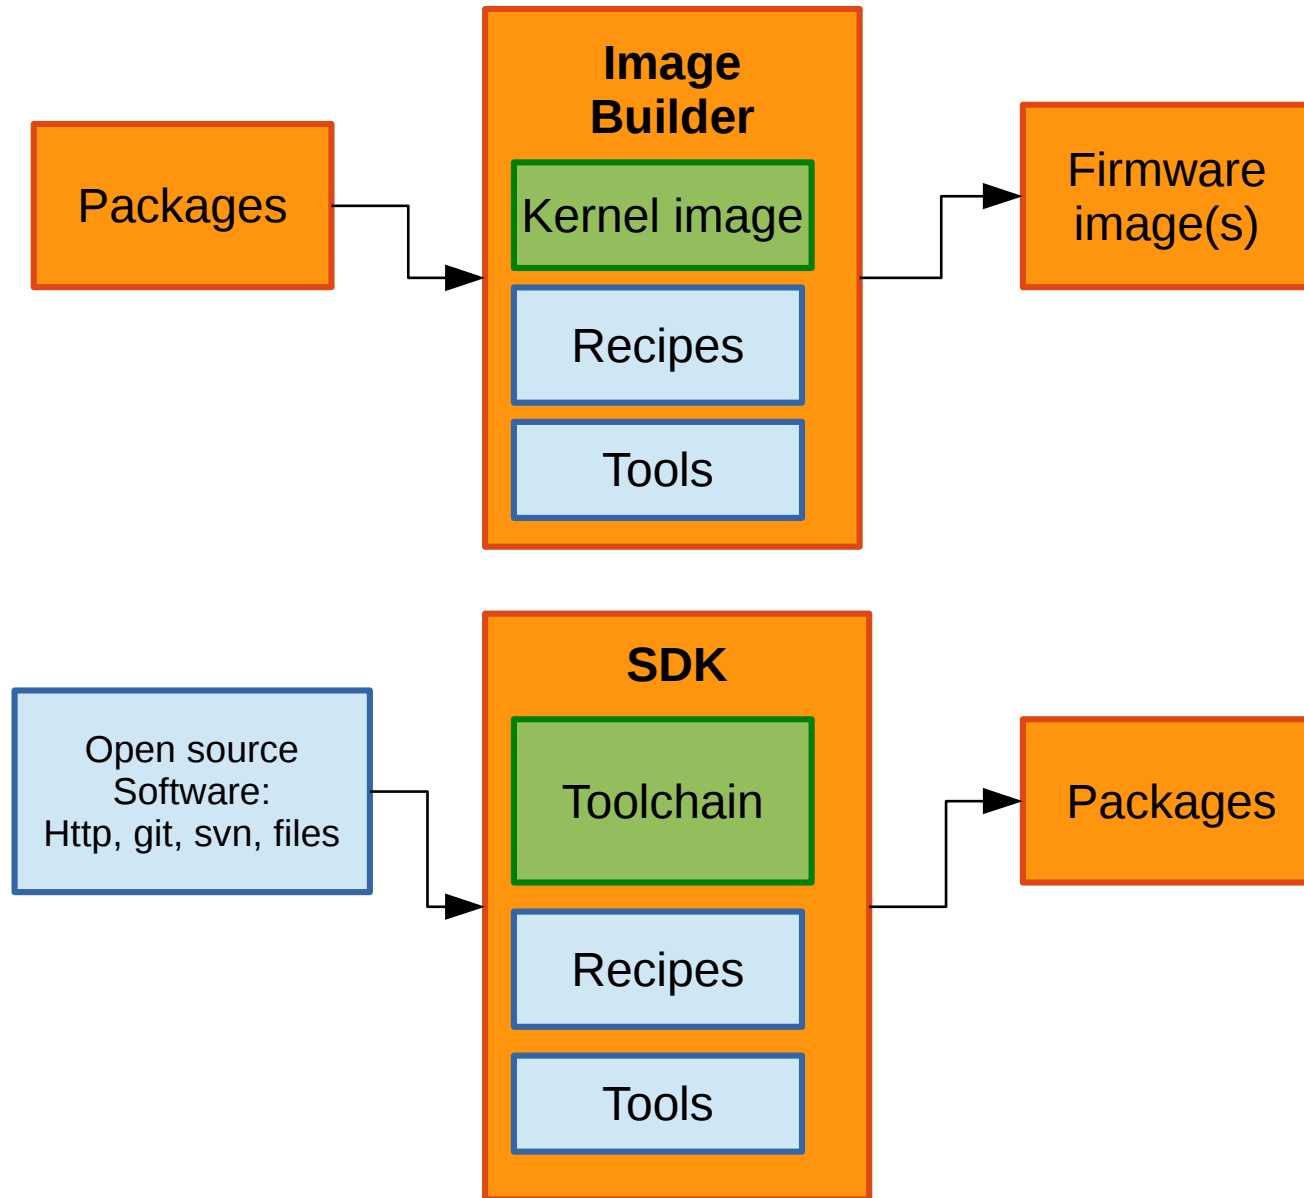

- Search, install and update additional packages

```
scripts/feeds update packages
```

```
scripts/feeds search "snmp"
```

```
scripts/feeds/install snmpd
```

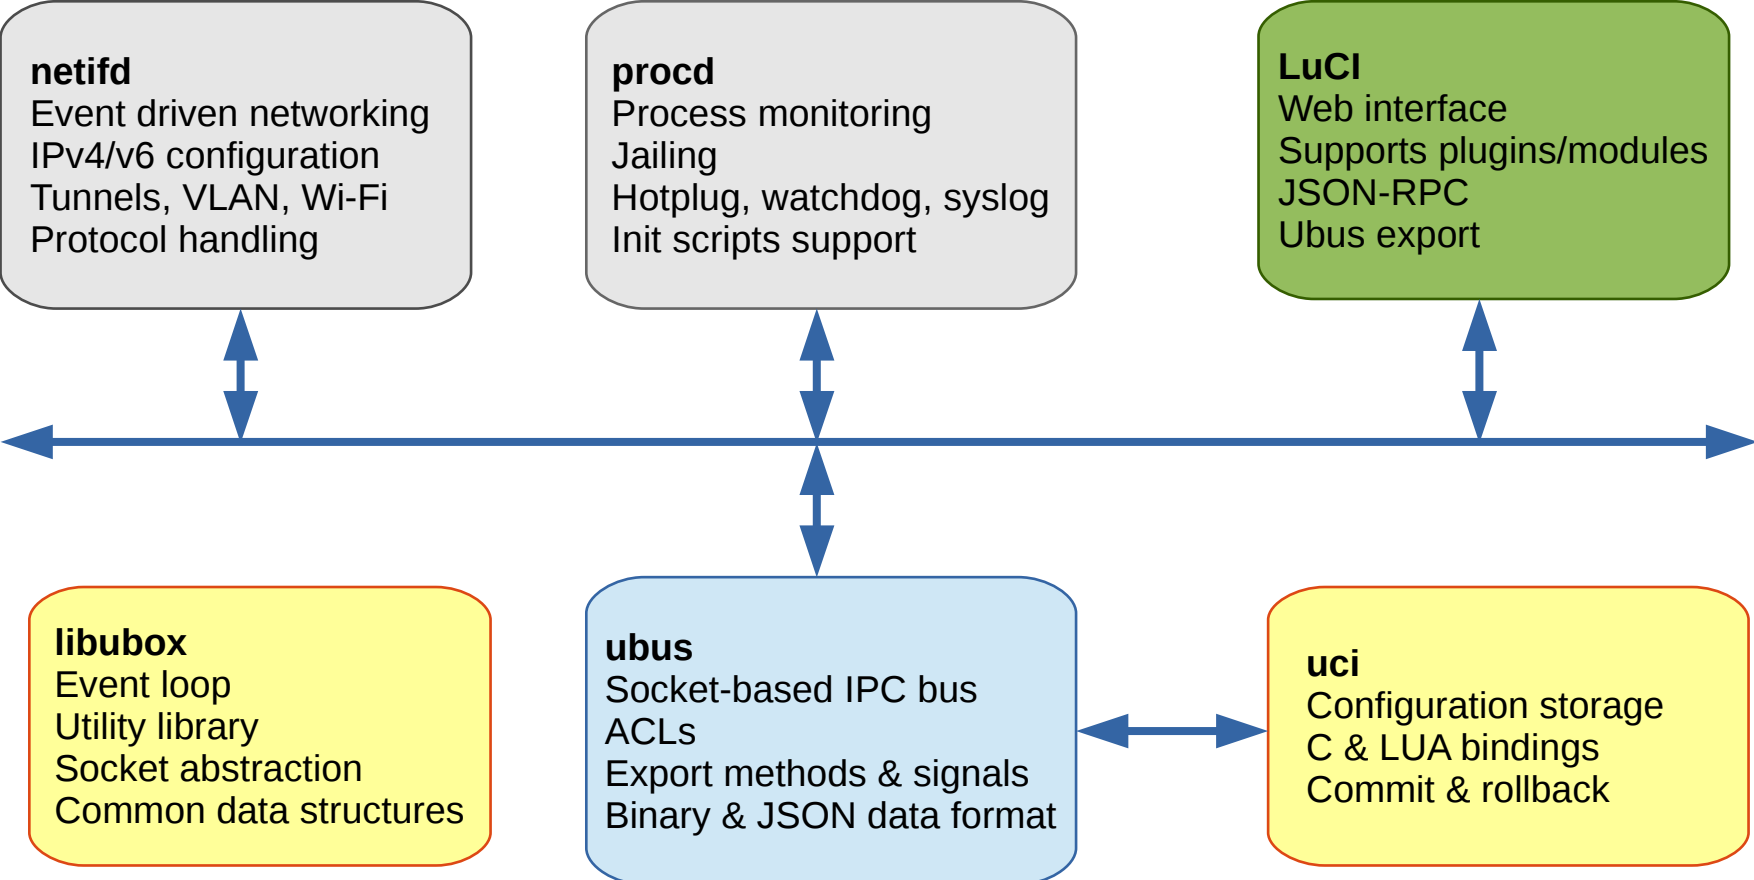

Development and deployment

Custom user-space, why?

- Modern systems require coordination between heterogeneous and discrete components
- User interfaces (CLI, web, GUI) change system configuration
- Networking devices are incredibly more complex (tunnels, provisioning etc.)
- Requirement for a proven, solid and consistent update mechanism

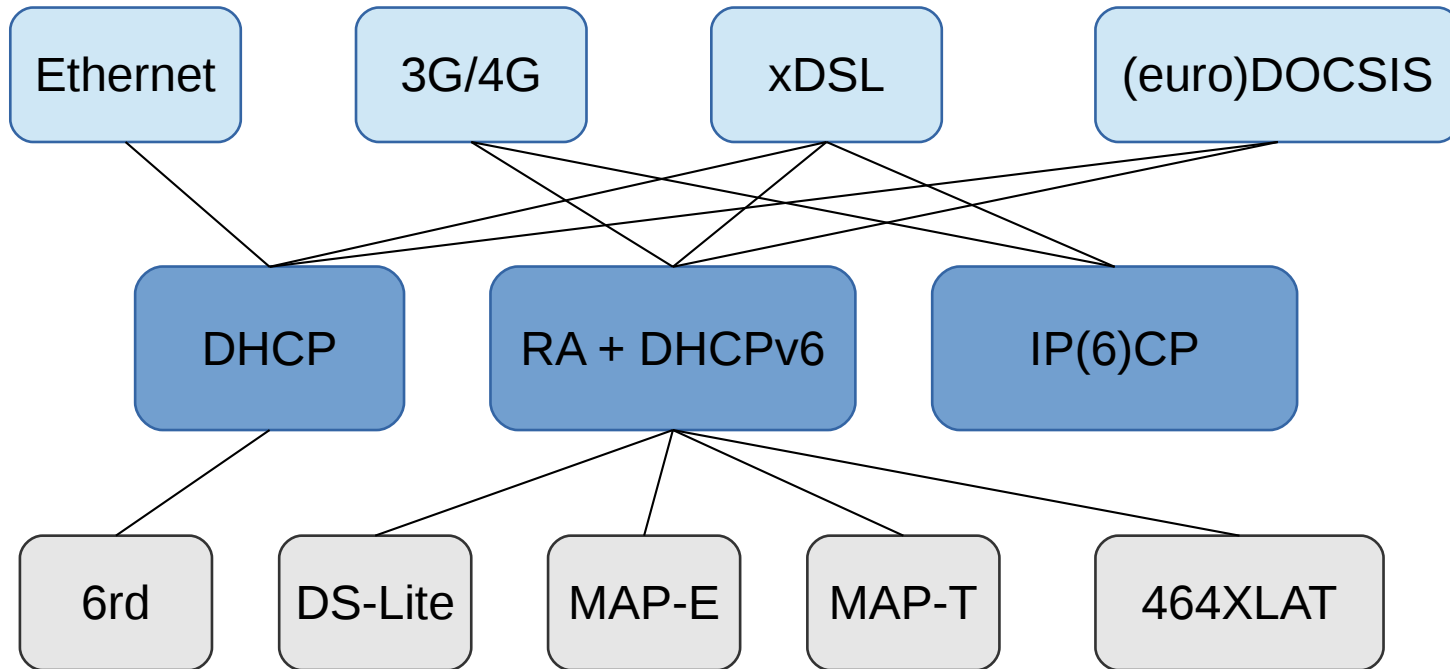

OpenWrt/LEDE software stack

System upgrades and failsafe

- System upgrades work consistently across devices:
 - Independent of the boot medium (SPI, NAND, eMMC)
 - Platform layer provides how to identify firmware image and where to flash kernel and root filesystem (partitions, mangling)
 - Scripts freeze system, preserve configuration files, and pivot_root to /tmp
 - Reboot into new version!
- Overlay FS allows marking the base system as read-only
 - But still allow read/write partition(s) for installable packages
 - Avoids wiping your entire system by accident
- Failsafe allows recovery of devices using device-specific buttons
 - Provides a recovery mechanism in case configuration is botched

Networking today

Configure only the minimum

Ethernet

```
config interface wan
  option ifname eth1
  option proto dhcp
```

```
config interface wan6
  option ifname eth1
  option proto dhcpv6
```

3G/4G

```
config interface wan
  option ifname wwan
  option pincode 1234
  option apn #apn#
```

PPPoX

```
config interface wan
  option ifname eth1
  option proto pppoe
  option username john
  option password doe
```

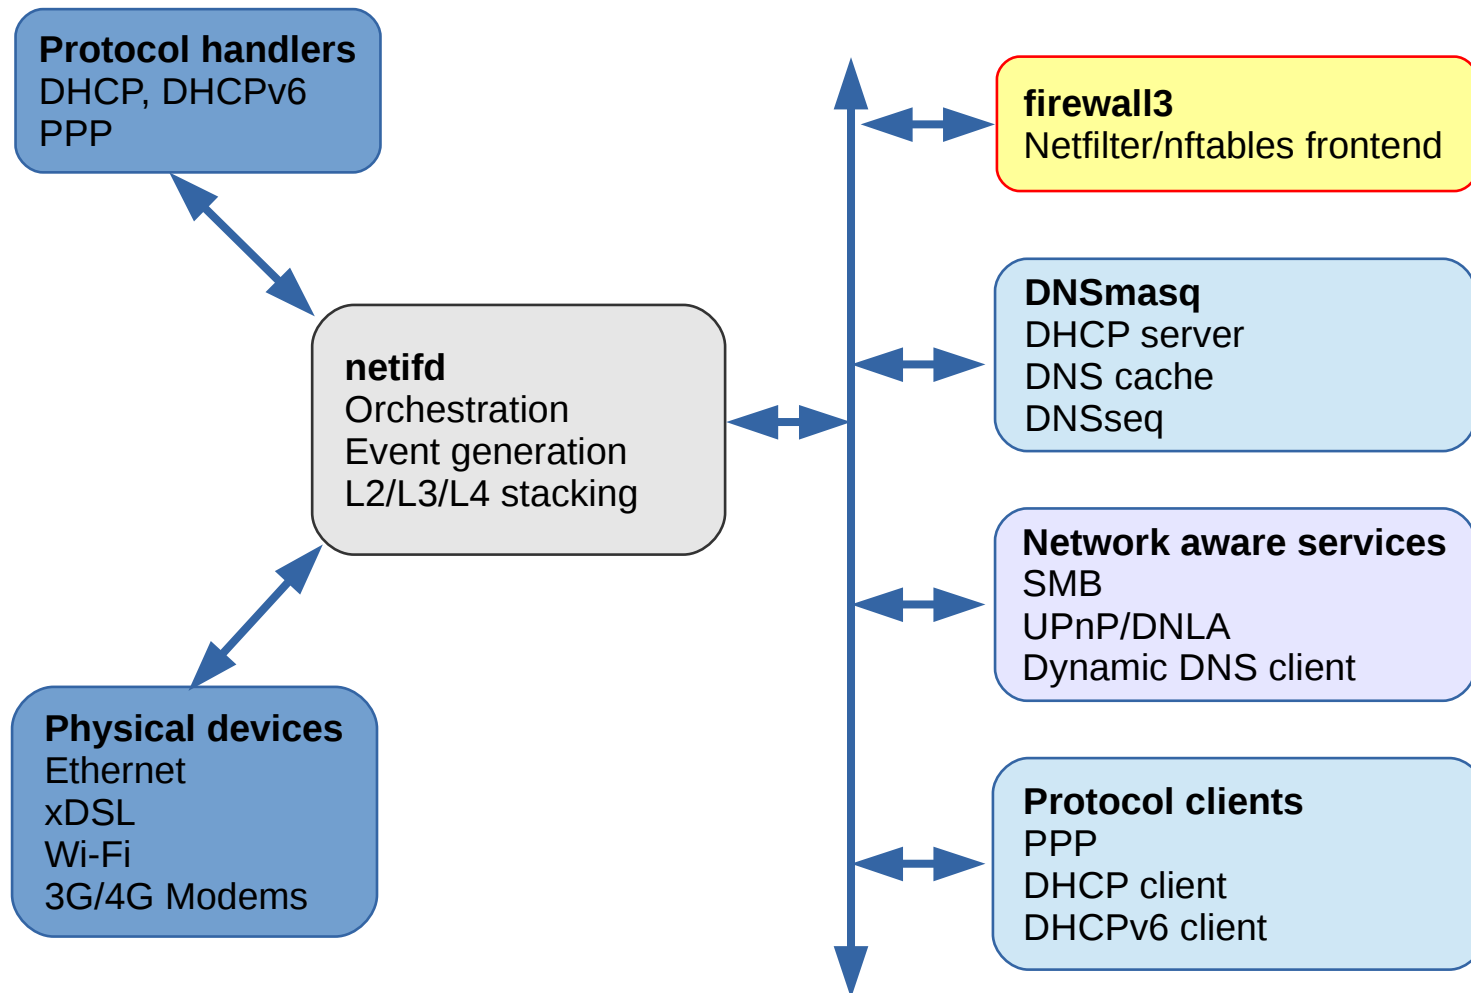

Ethernet

```
config interface lan
  option ifname eth0
  option type bridge
  option proto static
  option ipaddr 192.168.1.1
  option netmask 255.255.255.0
```

Wi-Fi

```
config wifi-iface
  option device radio0
  option mode ap
  option encryption psk-mixed
  option key ...
  option ssid ELC
  option network lan
```

And let netifd do the magic

Build-time security features

- Full/partial RelRO (configurable)
- Format-security checking (-Werror=format-security)
- Source fortification (-D_FORTIFY_SOURCE)
- Stack-smashing protector (user & kernel)
- Packages (*.ipk) are signed

Run-time security features

- Jails through procd to restrict filesystem access:

```
procd_add_jail dnsmasq ubus log
procd_add_jail_mount $CONFIGFILE $TRUSTANCHORSFILE $HOSTFILE /etc/passwd
/etc/group /etc/TZ /dev/null /dev/urandom $dnsmasqconfdir $dnsmasqconfdir
$resolvfile $dhcpcscript /etc/hosts /etc/ethers $EXTRA_MOUNT
procd_add_jail_mount_rw /var/run/dnsmasq/ $leasefile
```

- Flexible seccomp definitions to white list system calls:

```
procd_set_param seccomp /etc/seccomp/mdns.json
{
  "whitelist": [
    "read"
    "write"
    ..
    "brk"
  ]
}
```

And many more!

- Has existing ARM, MIPS and x86 targets that run in QEMU
- Packages with separate debug info
- Ex/inclusion of patented/specifically licensed packages
- Local package mirror, alternate download directory (corporate/development environments)
- Default IP, init-scripts, banner customization

Areas of improvements

- More continuous testing
 - Harder because of the wide variety of hardware
 - Leverage community and provide clear reporting guidelines
- Send more patches upstream
 - About 170 patches against Linux 4.9!
 - Migrate Qualcomm/Atheros AR71xx towards Device Tree (ath79)
- Opt-in security updates
- Documentation
 - Wiki
 - Table of hardware
 - Recommended, best supported, ranking of models

Conclusions

- It works great on your router, but equally well anywhere else!
- Fast, versatile, and flexible
- Turn-key user-space solution for products...
- ... that you can ignore for development only
- Extremely active communities

OpenWrt/LEDE reunification status

What happened?

- On March 5th 2016, a group of OpenWrt developers announced the formation of LEDE
- Two types of reaction:
 - Most people immediately welcomed LEDE and switched to it
 - A smaller group did not acknowledge the problem, and a flurry of emails ensued
- But essentially, it did signal there was a problem to be fixed with OpenWrt

Why LEDE?

- More transparency
 - All decisions made public
 - Give equal decisions rights to all project members
 - Establish clear processes and guidelines to operate the project (conflicts, external communication, release decisions..)
- Less centralization
 - Do not rely on single person owned infrastructure (DNS, servers, repositories...)
 - Freedom to move code and services based on newer requirements (CI, capacity etc.)
- Predictability
 - Make frequent releases
 - Leverage community testing
 - Easier integration process from contributor to developer

Meanwhile in OpenWrt

- Surprise,
-
-

Where are we today?

- Reunification terms:
 - LEDE code base to be used moving forward
 - OpenWrt team given LEDE repository access
 - Discussions on whether OpenWrt should stick as a name (trademark, larger popularity...)
- But right now, it's a stalled discussion...

What next?

- Release 17.01.0
 - So we can focus energy again on bringing the two projects together again
 - We critically need open source, recent and better software for our routers, users should have control and freedom!
- Meet, discuss and agree
 - In person
 - More frequently
 - On the the reunification terms
- And move forward together from there
