Time is ready for the Civil Infrastructure Platform

Yoshitake Kobayashi, Toshiba
Urs Gleim, Siemens AG
Embedded Linux Conference Europe, Berlin, October 13, 2016
Civil Infrastructure Systems are technical systems responsible for supervision, control, and management of infrastructure supporting human activities, including, for example,

- Electric power generation
- Energy distribution
- Oil and gas
- Water and wastewater
- Healthcare
- Communications
- Transportation
- Collections of buildings that make up urban & rural communities.

These networks deliver essential services, provide shelter, and support social interactions and economic development. They are society's lifelines.¹)

¹) adapted from https://www.ce.udel.edu/current/graduate_program/civil.html
Linux is widely used in ...

**Transport**
- Rail automation
- Automatic ticket gates
- Vehicle control

**Energy**
- Power Generation
- Turbine Control

**Industry**
- Industry automation
- Industrial communication
- CNC control

**Others**
- Healthcare
- Building automation
- Broadcasting
## Civil infrastructure systems

<table>
<thead>
<tr>
<th>Core characteristics</th>
<th>Business needs</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Industrial grade</strong></td>
<td><strong>Maintenance costs</strong></td>
</tr>
<tr>
<td>▪ Reliability</td>
<td>▪ Low maintenance costs for commonly uses software components</td>
</tr>
<tr>
<td>▪ Functional Safety</td>
<td>▪ Low commissioning and update costs</td>

<tr>
<td><strong>Sustainability</strong></td>
<td><strong>Development time</strong></td>
</tr>
<tr>
<td>▪ Product life-cycles of 10 – 60 years</td>
<td>▪ Shorter development times for more complex systems</td>
</tr>
<tr>
<td><strong>Conservative update strategy</strong></td>
<td></td>
</tr>
<tr>
<td>▪ Firmware updates only if industrial grade is jeopardized</td>
<td></td>
</tr>
</tbody>
</table>
The evolution of civil infrastructure systems

<table>
<thead>
<tr>
<th>Technology changes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Proprietary nature</strong></td>
</tr>
<tr>
<td>▪ Systems are built from the ground up for each product</td>
</tr>
<tr>
<td>▪ little re-use of existing software building blocks</td>
</tr>
<tr>
<td>▪ Closed systems</td>
</tr>
<tr>
<td><strong>Commoditization</strong></td>
</tr>
<tr>
<td>▪ Increased utilization of commodity (open source) components, e.g., operating system, virtualization</td>
</tr>
<tr>
<td>▪ Extensibility, e.g., for analytics</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Stand-alone systems</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>▪ Limited vulnerability</td>
</tr>
<tr>
<td>▪ Updates can only applied with physical access to the systems</td>
</tr>
<tr>
<td>▪ High commissioning efforts</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Connected systems</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>▪ Interoperability due to advances in machine-to-machine connectivity</td>
</tr>
<tr>
<td>▪ Standardization of communication</td>
</tr>
<tr>
<td>▪ Plug and play based system designs</td>
</tr>
</tbody>
</table>
Things to be done

• Join forces for commodity components
  • Ensure industrial grade for the operating system platform focusing on reliability, security, real-time capability and functional safety
  • Increase upstream work in order to increase quality and to avoid maintenance of patches

• Share maintenance costs
  • Long-term availability and long-term support are crucial

• Innovate for future technology
  • Support industrial IoT architectures and state-of-the art machine-to-machine connectivity
Civil infrastructure systems require a super long-term maintained industrial-grade embedded Linux platform for a smart digital future.
Civil Infrastructure Platform aims to provide industrial grade software

Establish an open source “base layer” of industrial grade software to enable the use and implementation in infrastructure projects of software building blocks that meet the safety, reliability, security and maintainability requirements.

- Fill the gap between capabilities of the existing OSS and industrial requirements.
- Provide reference implementation
- Trigger development of an emerging ecosystem including tools and domain specific extensions

Initial focus on establishing long term maintenance infrastructure for selected Open Source components, funded by participating membership fees
Railway Example

3 – 5 years development time

2 – 4 years customer specific extensions

1 year initial safety certifications / authorization

3 – 6 months safety certifications / authorization for follow-up releases (depending on amount of changes)

25 – 50 years lifetime
<table>
<thead>
<tr>
<th>Time Period</th>

<tr>
<td>20 – 60 years</td>
<td>Product lifetime</td>
</tr>
</tbody>
</table>
Power plant runs on the Linux (please visit our booth)
Why maintaining old kernels?

1. Fear of regressions in newer kernels (performance and system stability)

2. Reducing re-certification costs and time by minimizing changes

3. Reduced number of kernel versions to be provided by SoC vendors (like LSK or LTSI)

4. Serving as a common base for vendor-specific kernel forks and out-of-tree code (yes, we prefer upstreaming...)

see also http://lwn.net/Articles/700530/
Scope of activities

**User space**
- App container infrastructure (mid-term)
- App Framework (optionally, mid-term)

**Middleware/Libraries**
- Domain Specific communication (e.g. OPC UA)
- Shared config. & logging
- Safe & Secure Update
- Monitoring
- Security
- Real-time support
- Real-time / safe virtualization

**Kernel space**

**Tools**
- Build environment (e.g. yocto recipes)
- Test automation
- Tracing & reporting tools
- Configuration management
- Device management (update, download)
- Application life-cycle management

**Concepts**
- Functional safety architecture/strategy, including compliance w/ standards (e.g., NERC CIP, IEC61508)
- Long-term support
  Strategy: security patch management
- Standardization
  Collaborative effort with others
- License clearing
- Export Control Classification

**On device software stack**
- Product development and maintenance
<table>

Out of scope:
- Enterprise IT and cloud system platforms.

Reference hardware for common software platform:
- Start from working the common HW platform (PC)
- Later extend it to small/low power devices

1) Typical configurations Q1/2016

... Device class no.
Relationship between CIP and other projects

CIP will do not only development for CIP but also fund or contribute to related upstream projects

- Import source code from open source project or existing distribution to CIP
- Backport patches from upstream to CIP version
Upstream first policy for implementation of new features

All deltas to mainline to be treated as technical debt

• Avoid parallel source trees, directly discuss features in upstream projects
• Upstream first for fixes and features, just like for stable kernels
• Afterwards back-port to super long-term versions driven by CIP
Why super long term support? (Let’s look a typical development process)

1. Development for new system (3-5 years)
2. Certification/Authorization (1 year)
3. Customer specific adaptation (2-4 years)
4. BSP Development (3 month – 1 year)
5. Follow-up releases (3-6 month. Depending on changes)
6. Hardware replacement (?)
7. Typical LTS support term (2 years)
8. 20-50 years
9. Follow-up releases (3-6 month. Depending on changes)
10. 20-50 years
11. Development for new system (3-5 years)
12. Certification/Authorization (1 year)
13. Customer specific adaptation (2-4 years)
14. BSP Development (3 month – 1 year)
15. Follow-up releases (3-6 month. Depending on changes)
16. Hardware replacement (?)
17. Typical LTS support term (2 years)
Super Long Term Support - Motivation

**Upstream Kernel tree**
- Long-term support (LTS)
  - Backports bug fixes for 2 years

**Long-term support (LTS)**
- Approx. 2-5 years

**CEWG**
- Long-term support Initiative (LTSI)
  - Add extra functionality on LTS for embedded systems and support it for 2 years

**Every company, every project**
- Backport of bug fixes and hardware support: the same work is done multiple times for different versions.

- Release / Maintenance release

- About 3 months

- Approx. 2-5 years

- 10 years – 15 years
CIP kernel super long term support (SLTS) overview

Kernel.org

Upstream Kernel tree

Approx. 3 months

Long-term support (LTS)
Backports bug fixes for 2 years

Approx. 2-5 years

CEWG

Long-term support Initiative (LTSI)
Add extra functionality on LTS for embedded systems and support it for 2 years

Approx. 2-5 years

CIP

CIP super long-term supported kernel
Need to be maintained more than 10 years

Goal: 10 years - 15 years

Approx. every 3 years

Release / Maintenance release

Backports, e.g. for SoC support reviewed by CIP

After 5 years merge window for new features will be closed, CIP kernel changes focus to security fixes.
Announcement: The first CIP SLTS kernel version

4.4
Announcement: The first CIP SLTS kernel version

• CIP will maintain the Linux kernel 4.4 for more than 10 years

• Selection Criteria for the first SLTS kernel version
  • LTS version, ideally synchronized with LTSI
  • Broadly used for civil infrastructure systems
    • Currently deployed products
    • Upcoming products

• Next SLTS kernel version?
  • Will be announced in 2-3 years
  • Synchronize with LTSI kernel version at this timing
Super Long-Term Stable Team

• Ben Hutchings is first super long-term kernel maintainer
  • Well-known Debian contributor and package maintainer
  • Currently LTS maintainer for 3.2 and 3.16

• Ben will be supported by one additional developer

• Work started in September 2016
  • Setup of SLTS development and validation process
  • Prepare and perform first SLTS kernel release
  • Support CIP in extending SLTS model to further core packages
Plans for CIP SLTS kernel development

• Development Process
  • Development process will be similar to LTSI
    • Accept feature backports from upstream kernel
    • CIP will have merge windows and validation periods for feature backporting
  • Important NOTE: If the backport changes the kernel API, it will not be accepted

• Validation
  • Establishing kernel test infrastructure
  • Enhance on-target testing beyond boot-tests
  • Share the results for open spec boards
CIP Testing Considerations

Testing goals

• Perform testing on real HW (VM: no detail quirks and real-world issues)
• Focus on CIP reference platforms
• Critical Fixes: Build & test within hours on all machines
• No continuous functional testing (for instance, latencies)
• Super-Long-Term result preservation
• Align approach with established community best practices
CIP Testing Considerations (cont’d)

Current Status

- Initial CIP-private instance of Kernel CI (vagrant based)
  - Member companies can run local labs
  - HW rack standard (standardized physical and electrical setup) under consideration
- Purely local operation; results via central public web server once fully operational
- Job + Build scheduling: To be defined (likely Fuego and friends)
- Feed results back to Kernel CI?

Kernel-CI: [https://kernelci.org/](https://kernelci.org/)
Fuego: [http://elinux.org/Fuego](http://elinux.org/Fuego)
Selection Criteria for Userspace Packages

• Essential for booting and basic functionality
• Commonly used in civil infrastructure systems
• Security sensitive
• Likely maintainable over 10 years+ period
• We are open for proposals!
## Further Candidates for Super Long-term Maintenance

### An Example minimal set of “CIP kernel” and “CIP core” packages for initial scope

</tr>
</tbody>
</table>

**NOTE:** The maintenance effort varies considerably for different packages.
Development plan

CIP will increase the development effort to create industrial grade common base-layer

Phase 1:
- Define supported kernel subsystems, arch.
- Initial SLTS component selection
- Select SLTS versions
- Set-up maintenance infrastructure (build, test)

Phase 2:
- Patch collection, stabilization, back port of patches for CIP kernel packages
- Support more subsystems
- Additional core packages

Phase 3:
- Domain specific enhancements, e.g. communication protocols, industrial IoT middleware
- Optionally: more subsystems
- Optionally: more core packages

Core Packages

Kernel (SLTS)

add. pkgs

Core Packages

Kernel (SLTS)

add. pkgs

Core Packages

Kernel (SLTS)
Currently under discussion

- CIP should collaborate with other similar efforts
  - LSK (Linaro Stable Kernel)
  - Other distributor or SoC vendors
- Selection of features for backporting
  - PREEMPT_RT
    - PREEMPT_RT might be merged into separate branch
  - KSPP (Kernel Self Protection Project)
- Testing infrastructure (KernelCI + Fuego)
- Kernel maintenance policy
- Userland package selection
Milestones

• 2016:
  • Project launched announcement at Embedded Linux Conference 2016
  • Requirements defined, base use cases defined, technical & non-technical processes established (license clearing, long-term support), maintenance plan
  • Common software stack defined, related core projects agreed (e.g. PREEMT_RT, Xenomai), maintenance infrastructure set up
  • Domain specific extensions defined, tool chain defined, test strategy defined
  • Maintenance to be operational and running

• 2017:
  • Realization phase of selected components

• 2018:
  • Advancement, improvements, new features
Please join!

Provide a super long-term maintained industrial-grade embedded Linux platform.

Why join CIP?

• Participate in **project decisions** through the governing board and/or committees; leverage an ecosystem of like-minded participants to help drive project priorities as a community.

• Provide **technical direction** through a TSC representative enabling fast engagement and input into the technical direction of the project.

• Demonstrate support for CIP.

• Priority access to any events, sponsorship and marketing opportunities. Potential events include:
  - Embedded Linux Conference
  - LinuxCon
  - Collaboration summits
  - Other community events

• Visibility on the CIP website and in membership collateral
