

Package Management in Yocto Project

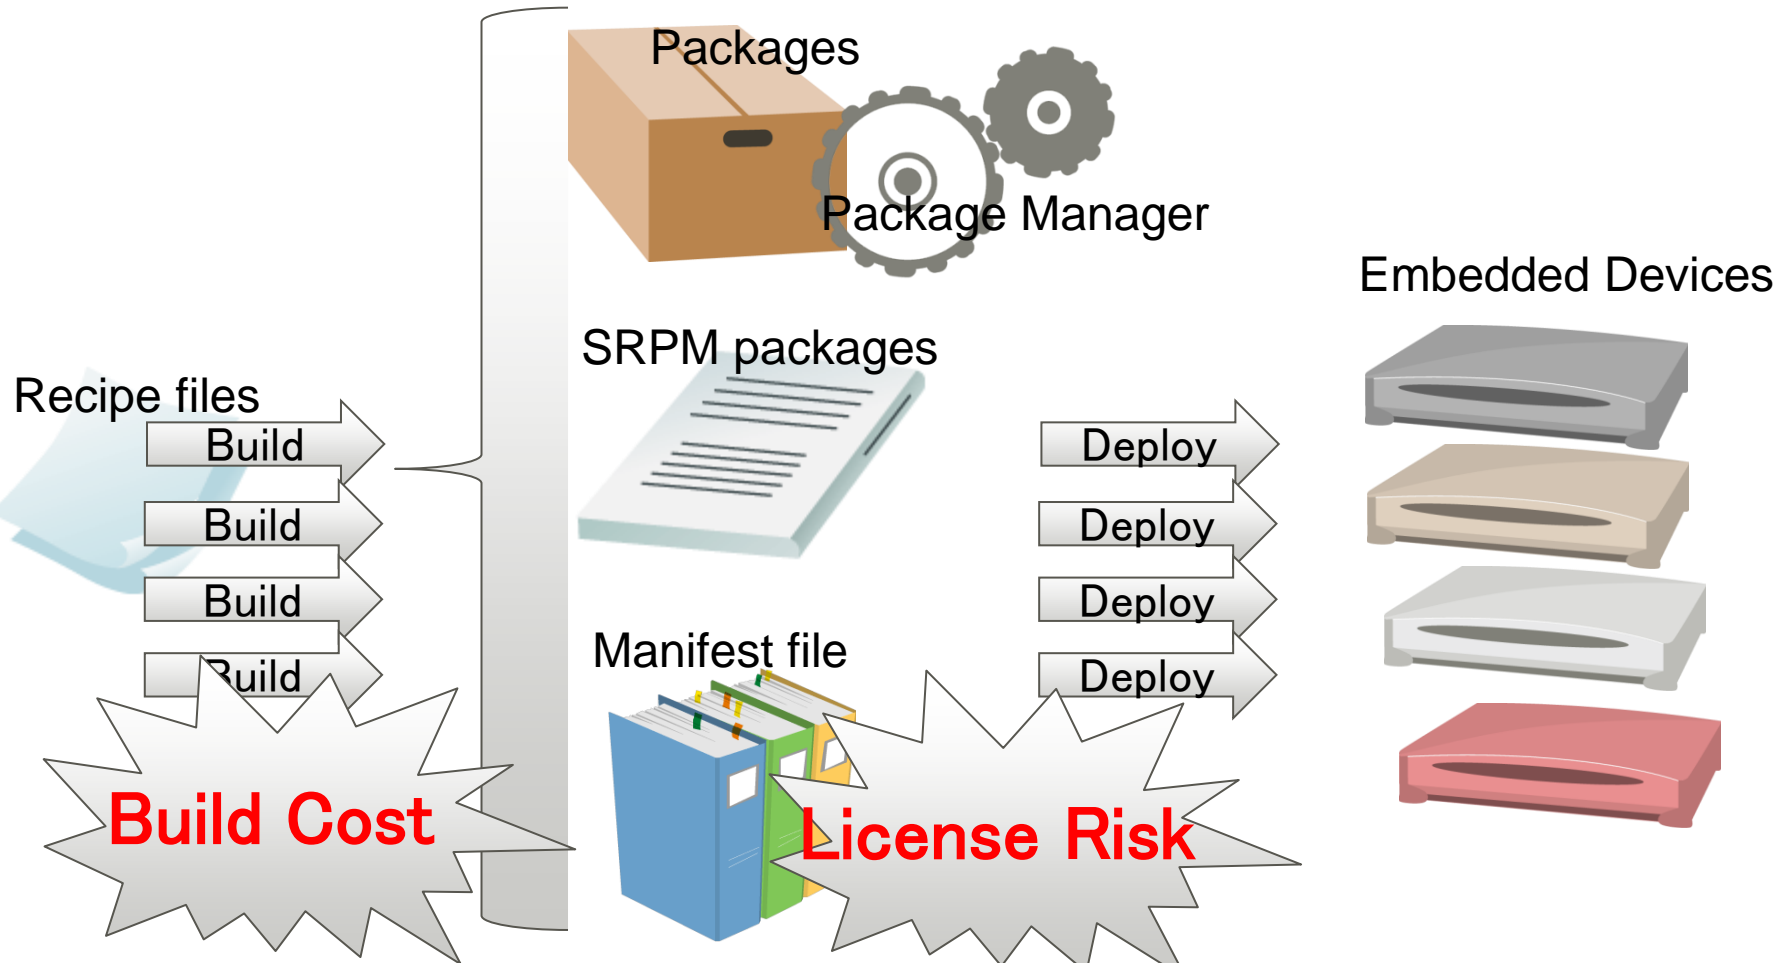

Feb 21th, 2017

Fan Xin, Fujitsu Computer Technologies Limited

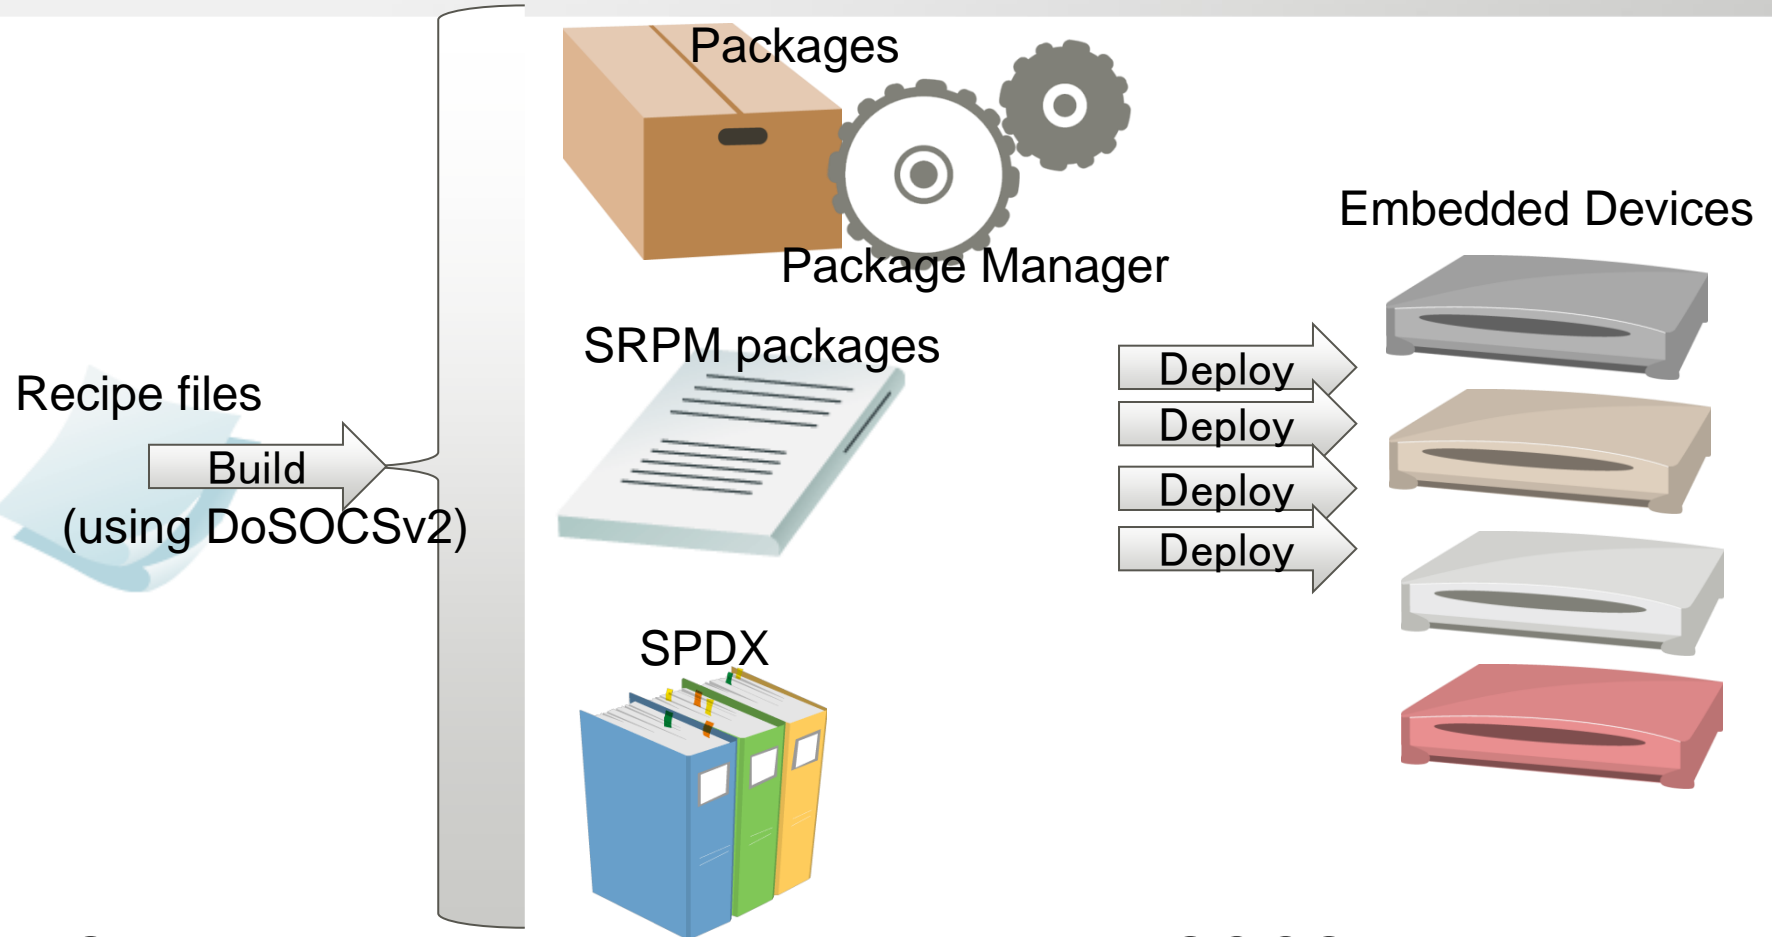

- Currently, Yocto Project uses manifest to manage package and license info.

When situation changes...

- For variation device target and deploy, the whole project need to built again and again. When the number of target and deploy increases, the build cost rise quite significantly.

- Smart Package Manager could use DoSOCSv2 to process the package file and SRPM package to generate SPDX file to manage OSS license info.
