

# Linux - the future for drones

Lucas De Marchi, Intel

ELCE 2015

# Who am I

- Software developer
- Contributed to several open source projects throughout the Linux stack
- Recently joined projects under the Dronecode
- Linux maintainer for Ardupilot

# Agenda

- Dronecode
- Hardware evolution
- Software evolution
- Handling the complexity and scaling
- Future

**Dronecode**

“If you want to go **quickly** go alone,  
if you want to go **far** go together”

# Dronecode

- 40+ members
- Composed of several projects, including  
2 flight stacks
- Contributions to each of them increasing

# Dronecode

# Hardware evolution

ArduPilot

Pixhawk2  
2015

# Hardware evolution

Ardupilot - Linux Boards

It all started with a single board,  
with a specific set of sensors in a daughter board:

BeagleBone Black + PXF cape

# Hardware evolution

Ardupilot - Linux Boards

- |             |      |
|-------------|------|
| ▪ PXF       | 2014 |
| ▪ ErleBoard | 2014 |
| ▪ BBBMini   | 2015 |

Expansion boards for BeagleBone Black

- |                  |      |
|------------------|------|
| ▪ Navio/Navio+   | 2014 |
| ▪ Raspilot       | 2015 |
| ▪ ErleBrain2*    | 2015 |
| ▪ VR Brain 5 LX* | 2015 |

Expansion boards for Raspberry Pi

# Overview how a drone works

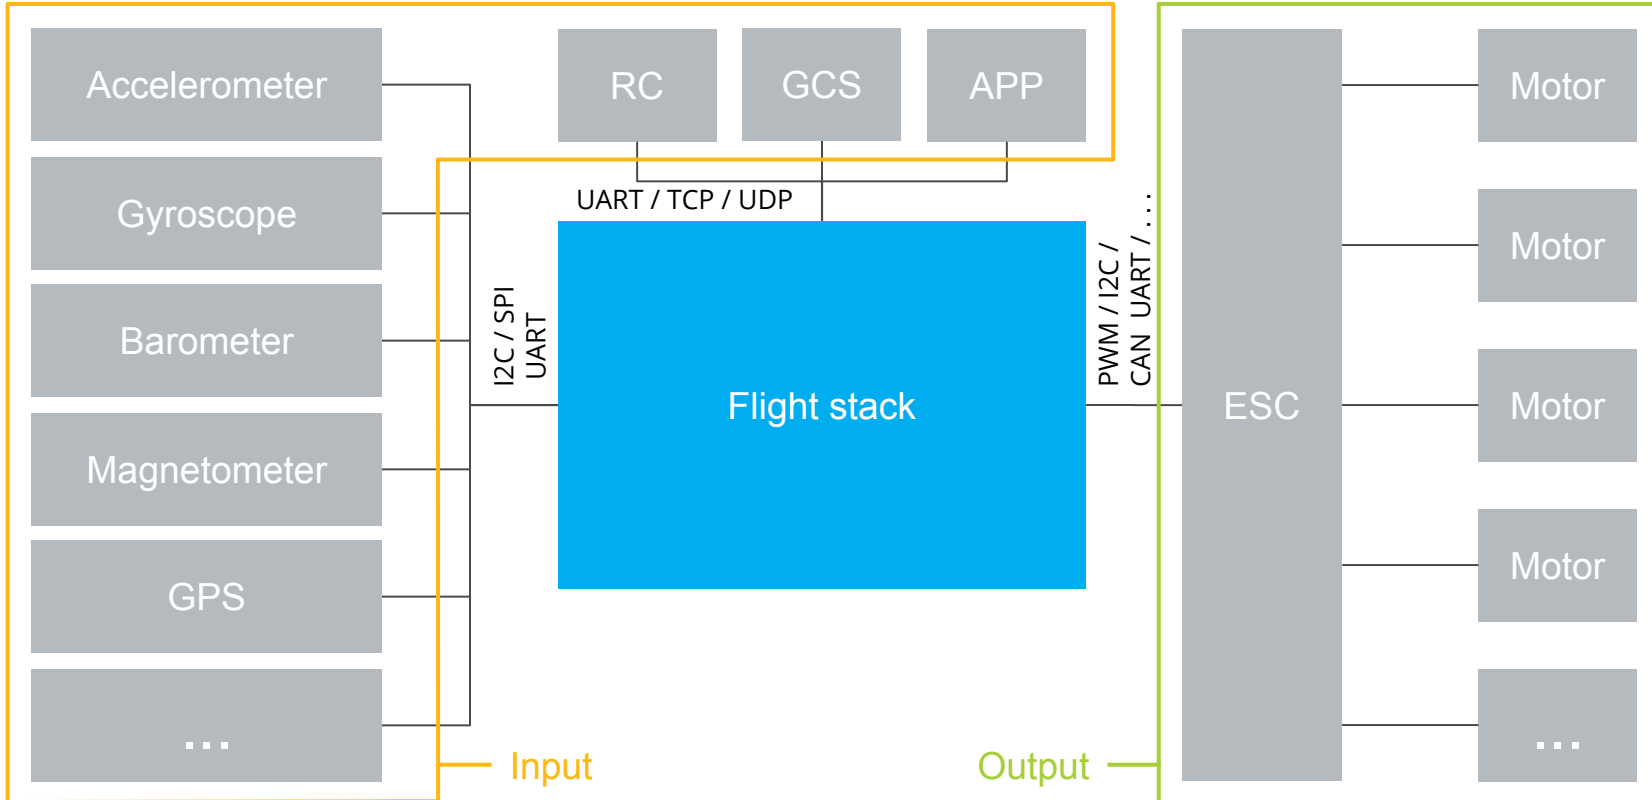

# Hardware/software evolution

101 - How a drone actually works (simplified)

# Hardware/software evolution

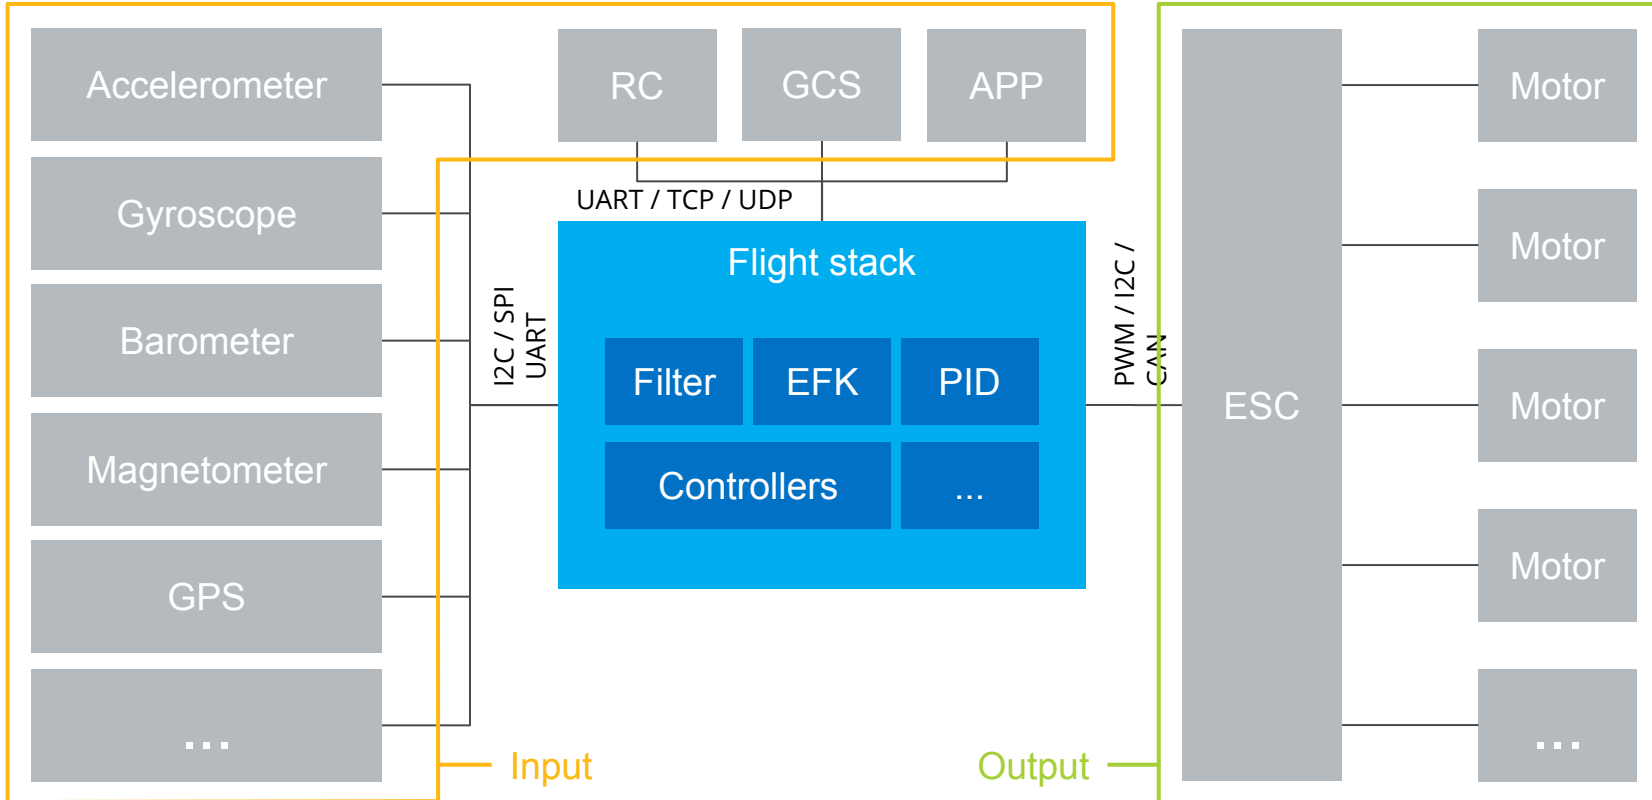

101 - How a drone actually works (simplified)

# Hardware/software evolution

101 - How a drone actually works (simplified)

# Software evolution

# Software evolution

## Sensors

- From few samples per second to thousands
- Redundancy
- More complex sensors
  - Lidar
  - Optical Flow
  - Depth cameras
  - Computer vision

# Software evolution

“Low-level” flight stack

- Increasing accuracy (hence complexity) of control algorithms
  - E.g. the move to EKF for AHRS

# Software evolution

Usages - pushing the complexity

- Photography
- Agriculture
- Survey / Mapping
- Inspection
- Deliveries
- Search and rescue

# Software evolution

## Outcome

- Drones becoming smarter
- Intelligence inside vs outside
- Increased CPU and memory requirements
- Need to scale for more hardware platforms

**Handling the complexity and scaling**

# Handling the complexity and scaling

Boards in Ardupilot

- APM1 and APM2 are deprecated
  - Not enough RAM, flash and CPU anymore

# Handling the complexity and scaling

Sensors in Ardupilot

- Support for more sensors, different manufacturers
- Linux boards becoming first class citizens
  - PX4-only features moving to common code
  - Linux-only features starting to appear (existing infrastructure in Linux)

# Handling the complexity and scaling

When microcontrollers are not enough anymore

- Companion computer
  - Move complex tasks to a separate Linux board
  - Move flight stack to a separate microcontroller
- Single board Linux solution
  - Both flight stack and other tasks on same board

# Handling the complexity and scaling

When microcontrollers are not enough anymore

- Companion computer
  - Move complex tasks to a separate Linux board
  - Move flight stack to a separate microcontroller
- Single board Linux solution
  - Both flight stack and other tasks on same board

**This is the solution taken for the Linux boards currently supported in Ardupilot**

# Handling the complexity and scaling

Single board Linux solution

- Realtime
- Offload specific part(s) of the stack
  - To separate microcontroller (even inside the SoC)
  - To dedicated off-the-shelf hardware

# Handling the complexity and scaling

Single board Linux solution

1. Move single-digit  $\mu$ s precision off the CPU: PWM output, RC decoding (PPM, SBUS, DSMX), tone generator, etc.
2. Follow guidelines for RT tasks in Linux
3. Have the necessary buses exposed
4. Cheers your new Linux-based flight stack

**Future**

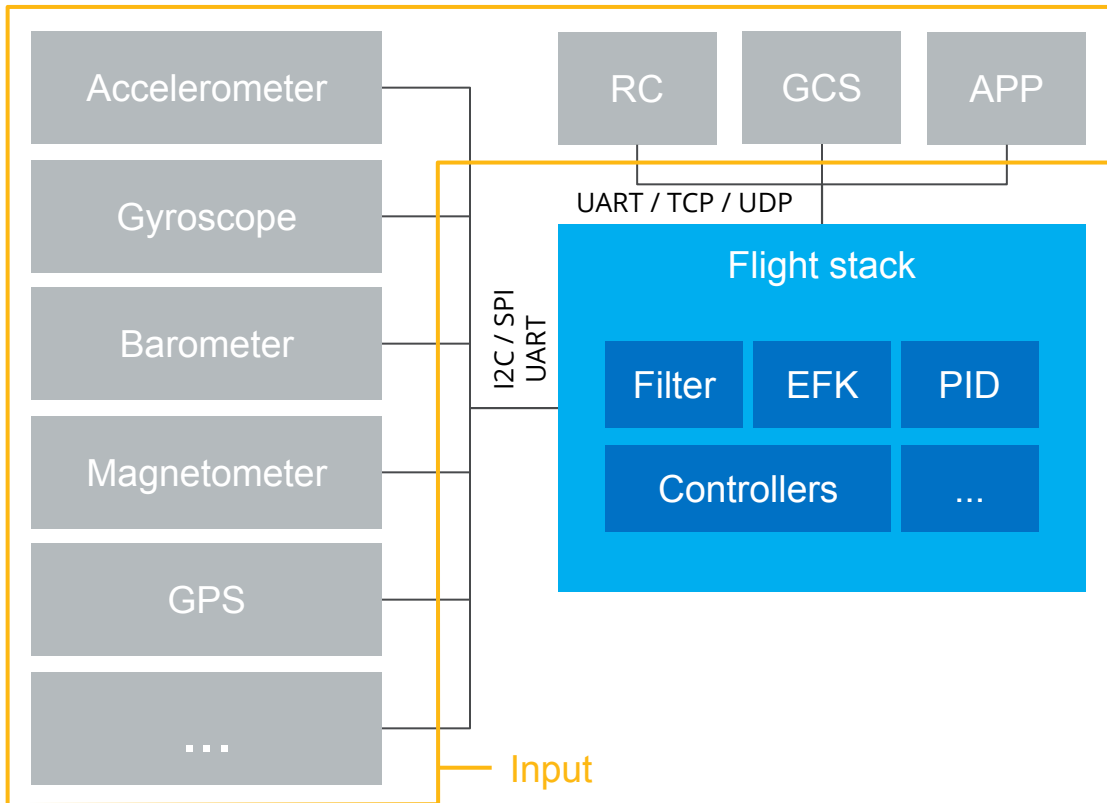

# Future

Scaling for new boards

- Support for new boards (LIVE “DEMO”)
- Make adding new boards easier and scalable
  - Runtime detection / configuration
- Different platforms
- Increased complexity

# Future

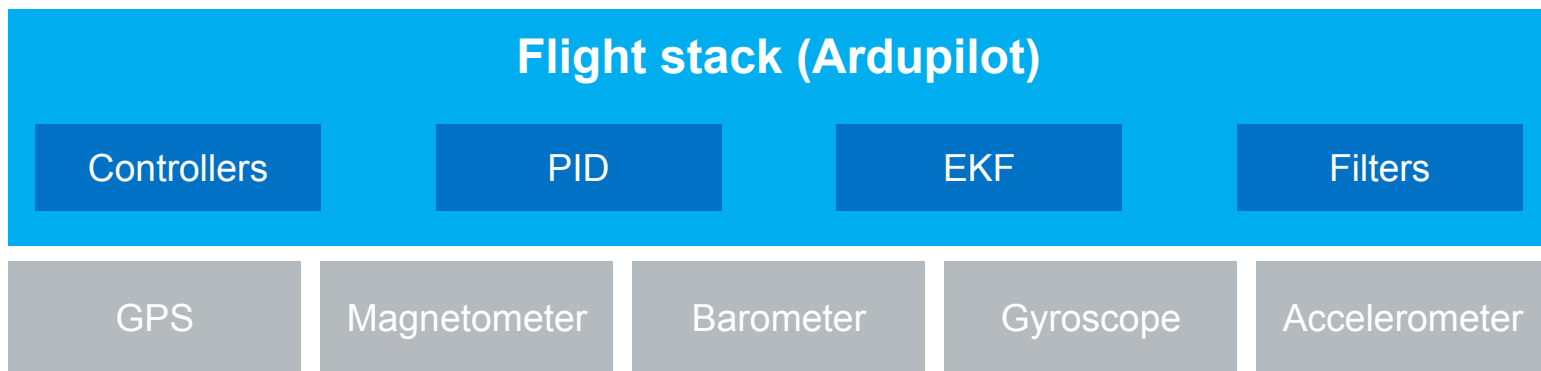

Scaling for new sensors

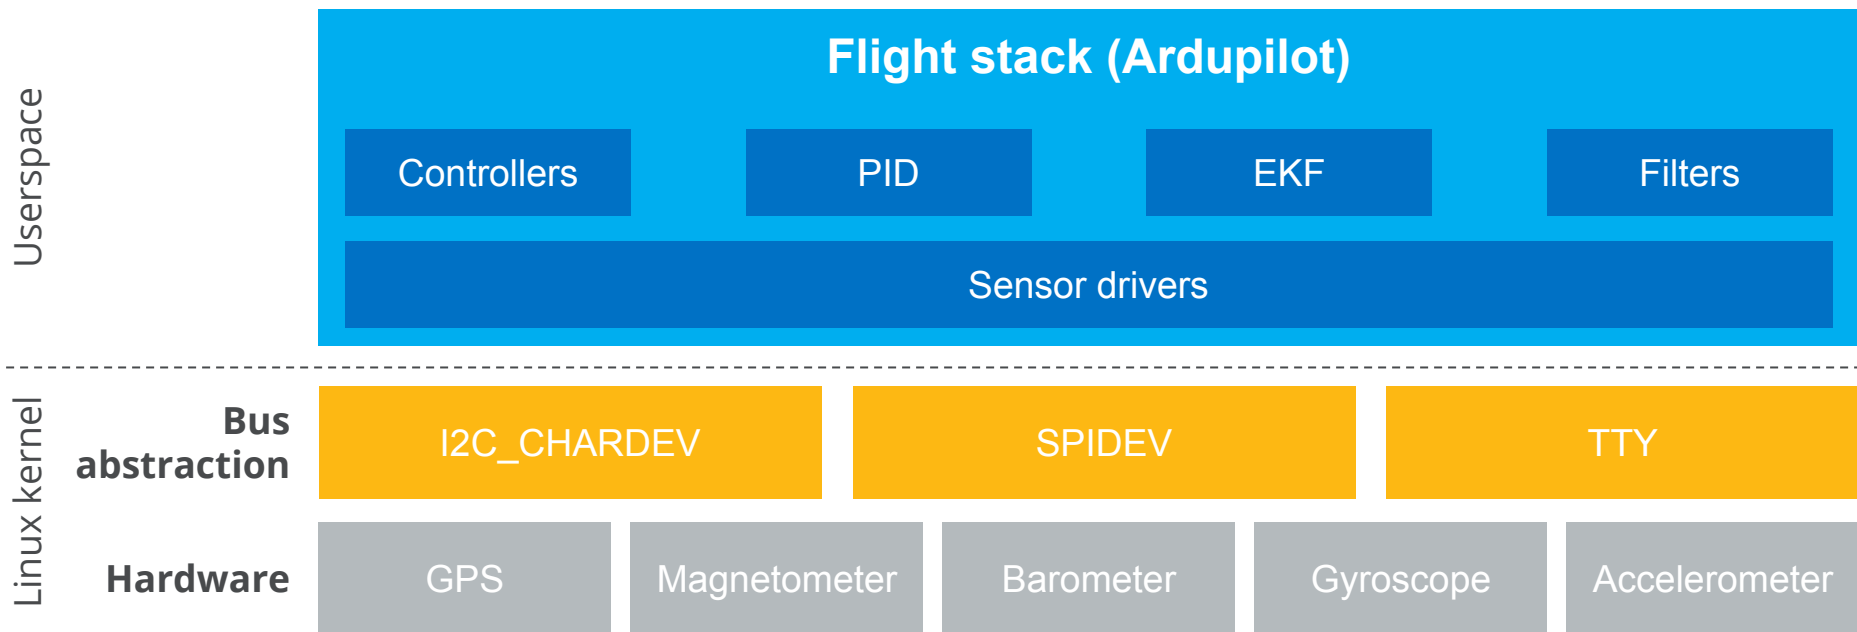

# Future

Scaling for new sensors

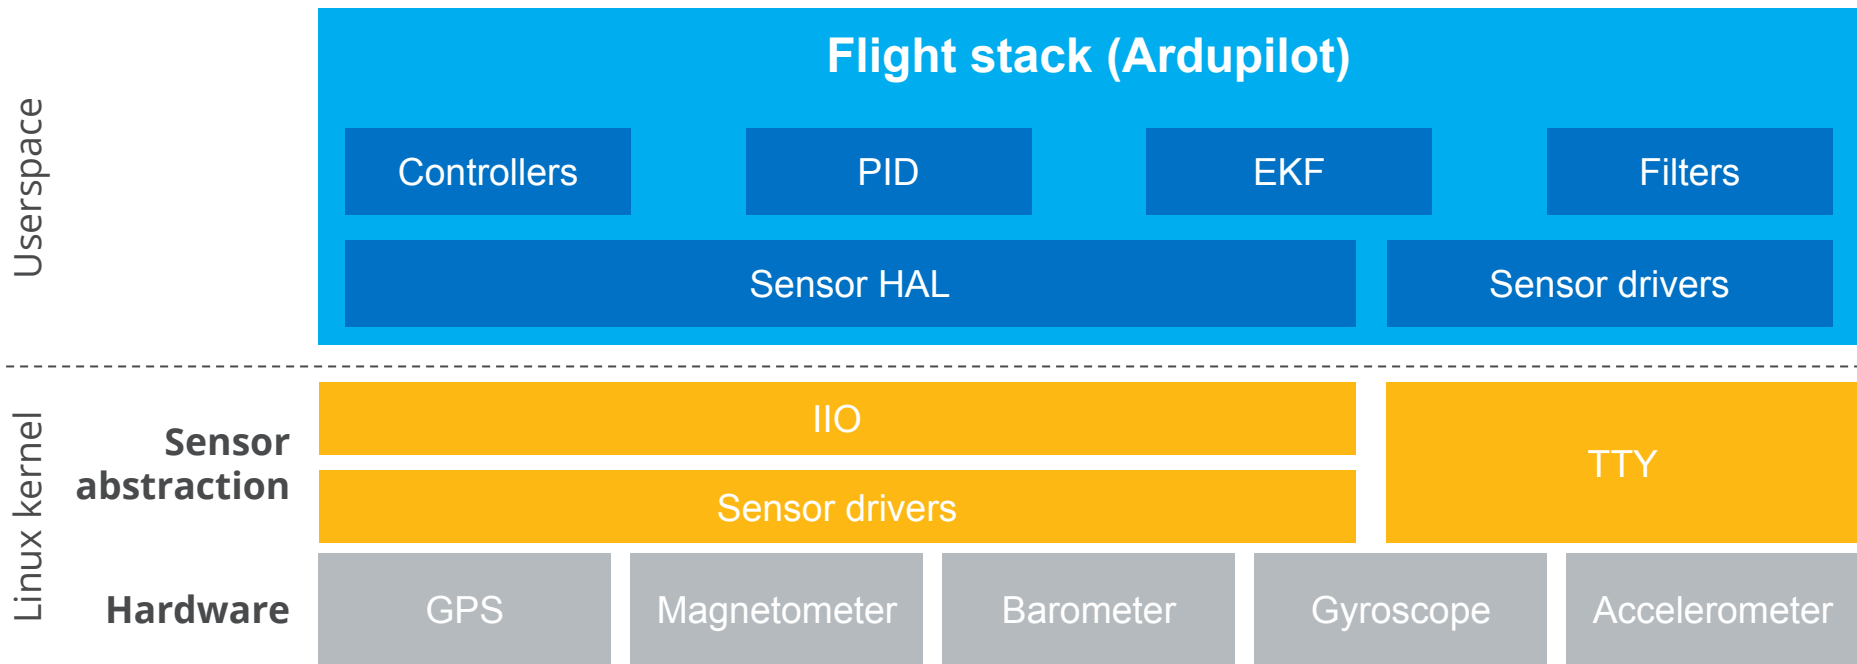

# Future

Scaling for new sensors

# Future

Scaling for new sensors

# Future

Scaling for new sensors

## Use kernel drivers (IIO subsystem)

### Pros:

- Several drivers already available
- Share testing with other platforms (Linux desktop, Android)
- Reduce complexity on the flight stack
- Reduce overhead to communicate with sensor: flight stack access data stream

### Cons:

- Can't share driver with other platforms (PX4 middleware / Nuttx)
- Harder to prototype new drivers
- Currently used sensors don't have kernel drivers or don't have the right interfaces

**Middle ground: support both for separate buses**

# Future

aka dreams

- Linux boards to foster use of new algorithms
- New sensors
- Smarter autonomous drones

# Wrap-up

- Drones growing in application and capabilities
- Linux provides scaling at HW and SW levels
- Sharing parts with other projects improves code quality and testability

# Q&A
