Solving Device Tree Issues

Use of device tree is mandatory for all new ARM systems. But the implementation of device tree has lagged behind the mandate. The first priority has been correct function. Lower priorities include device tree validation and facilities to debug device tree problems and errors. This talk will focus on the status of debug facilities, how to debug device tree issues, and debug tips and tricks. Suggestions will be provided to driver writers for how to implement drivers to ease troubleshooting.

Frank Rowand, Sony Mobile Communications  
October 6, 2015
CAUTION

The material covered in this presentation is kernel version specific

Most information describes 3.16 - 4.3-rc3

In cases where arch specific code is involved, there will be a bias to looking at arch/arm/
Read this later

Any slides with 'skip' in the upper right hand corner will be skipped over in my talk. They contain information that will be useful when the slides are used for reference.
Obligatory Outline

Device tree concepts
DT data life cycle
Comparing Device Tree Objects  <----- skip if time short
  - DT at different points in the life cycle
  - the magic of dtdiff
Device Creation, Driver Binding
  - dyndbg
  - dt_stat
  - dtdiff
Why this talk?

Debugging device tree problems is not easy.
Why this talk?

Debugging device tree problems is not easy.
- tools do not exist or are not sufficient
- error and warning message may not be available or helpful
- state data is not easy to access and correlate
- debug process is not well documented
- add your own reason here
Why this talk?

At the end of this talk, you will know how to:
- debug some common device tree problems
- access data to support the debug process

Debugging some types of device tree problems will be easier.
Chapter 1

Device tree concepts
why device tree?

A device tree describes hardware that can not be located by probing.
what is device tree?

“A device tree is a tree data structure with nodes that describe the devices in a system.”

“Each node has property/value pairs that describe the characteristics of the device being represented.”

(source: ePAPR v1.1)
Key vocabulary

node
- the tree structure
- contain properties and other nodes

property
- contains zero or more data values providing information about a node
'compatible' property has pre-defined use

node '/':
- will be used to match a machine_desc entry

other nodes:
- will be used to match a driver
  (slight simplification)
.dts - device tree source file

/ { /* incomplete .dts example */

    concept: variable value
Thomas Pettazzoni's ELC 2014 talk
“Device Tree For Dummies” is an excellent introduction to

- device tree source
- boot loader mechanisms
- much more!

https://www.youtube.com/watch?v=uzBwHFjJ0vU
DT data life cycle and vocabulary

(source) .dts  (compiler) dtc  (binary blob) .dtb

boot loader:  dtb'  boot image:  vmlinux
memory:      dtb'' [ dtb' ]

dtb'' FDT (flattened device tree)
EDT (expanded device tree)

linux kernel
DT data life cycle

dtc creates .dtb from .dts

boot loader copies .dtb into memory FDT

Linux kernel reads FDT, creates Expanded DT

   .dtb may be modified by
       build process
       boot loader

FDT and Expanded DT may be modified by
   Linux kernel
DT data life cycle and vocabulary

(source) .dts → (compiler) dtc → (binary blob) .dtb → [ overlay ] .dtb

- boot loader: dtb'
- boot image: vmlinux
- memory: dtb'' FDT (flattened device tree)
- EDT (expanded device tree)

linux kernel
DT data life cycle (overlay)

dtc creates .dtb from .dts and .dtsi

Linux kernal reads overlay, modifies Expanded DT

Overlay .dtb may be modified by ???

Expanded DT may be modified by Linux kernel

Overlay architecture and implementation still under development.
Chapter 2
Comparing Device Tree Objects
Skipping forward about 67 slides

The stuff I am skipping is valuable and interesting. But I had to choose a big section to leave out due to lack of time...
Suspicion

When debugging

I do not trust anything

I suspect everything
Suspicion

When debugging

I do not trust anything
I suspect everything

How do I know if my Expanded Device Tree matches what is in my device tree source?
Suspicion

When debugging

I do not trust anything
I suspect everything

How do I know if my Expanded Device Tree matches what is in my device tree source?

If I expected the bootloader to alter the .dtb, how do I verify the changes?

diff target FDT with target EDT
```
Full Disclosure

1) The content of the previous diffs are modified so they will fit on slides.

2) I removed the /testcase-data node from the target EDT before each diff with the target EDT. The /testcase-data nodes will be present on the target if CONFIG_OF_UNITTEST=y
Resources

See the entry for this talk on the “Resources” slide for more details on how to access the DT data at various stages of the build and boot process.

FDT and EDT are from the target system

- FDT is /sys/firmware/fdt
- EDT is /proc/device-tree
  (currently a link to /sys/firmware/devicetree/base)
Takeaway

A diff tool exists to examine how the device tree data is modified in the build, boot loader, and boot process.
Wait a minute!!!

What is this tool?
Where do I get it?
Why don't I just use 'diff'?
dtdiff - What is this tool?

dtdiff compares device trees in various formats

- source (.dts and the .dtsi includes)
- dtb (binary blob)
- file system tree

For one source device tree

- pre-process include file directives and create resulting source (that is, converts .dts files and included .dtsi files into a single .dts)
dtdiff - Where do I get it?

It might be packaged for your distribution:

device-tree-compiler
dtc

The maintainer's git repo:

git clone git://git.kernel.org/pub/scm/utils/dtc/dtc.git
dtdiff - Where do I get it?

dtdiff uses the dtc compiler to convert each input device tree to .dts format

Note that the Linux kernel build process uses its own version of the dtc compiler, built from the Linux kernel source tree:

```
${KBUILD_OUTPUT}/scripts/dtc/dtc
```

Make sure you use this version of dtc, not the version from your distro.
dtdiff - Where do I get it?

WARNING: the current version does not properly handle #include and /include/ for .dts and .dtsi files in the normal locations in the Linux kernel source tree.

Work In Progress patch to fix this and to add the pre-process single .dts file feature is at:

http://elinux.org/Device_Tree_frowand
http://elinux.org/images/a/a3/Dtdiff_add_cpp.patch
dtdiff - Why don't I just use 'diff'?

Device tree .dtb files are binary files. diff does not work on binary files.
dtiff - Why don't I just use 'diff'?

Device tree file system trees are nested directories containing a mix of ascii and binary files. You can normally use diff on ascii files but DT fs trees are produced from /proc/device-tree and are not '\n' terminated, so diff treats them as binary files (use diff -a or --text.)
dtdiff - Why don't I just use 'diff'?

Device tree .dts and .dtsi source files are ascii, similar to C .c and .h files. You can use diff!
dtdiff - Why don't I just use 'diff'?

real-life answer: Because dtdiff is
- so much better than diff
- easier to use than diff

Except in the rare cases where it hides information that you need!
dt diff - Why don't I just use 'diff'?

The answer to this question is going to be a long meandering journey through many slides. I may speed through many of those slides today but suggest you read them later at your leisure.

When a property at a given path occurs multiple times, the earlier values are discarded and the latest value encountered is used.

Redefinition of a property is not an error.
dtdiff meander - C vs dtc

C:

Redefinition of a variable initialization value is an error
dtdiff meander - C vs dtc

dtc:

.dtsi source file describes a HW object which may be used in many ways
When .dts includes a .dtsi, it may need to change the general HW description because of how it is used in the current system

Redefinition of properties is a critical and common pattern in DT source files
Redefinition of properties in DT source files means the mental model for comparing two device trees is often different than for comparing the source files for two C programs.
dtdiff meander - node/property order

Example:

reverse the order of the two instances of node “/”
dtdiff meander - node/prop order

dtdiff meander - node/prop order

dtdiff adds a sort to the decompile step

***** RED FLAG *****

Sometimes order in Expanded DT does matter!!!

If you are debugging a problem related to device creation or driver binding ordering then you may want to be aware of changes of node order. (Use dtdiff “-u” option)
The previous examples of two instances of the same node in the same file are somewhat contrived.

But multiple instances of a node in a compilation unit is an extremely common pattern because of the conventions for using .dtsi files.
dtiff meander - .dtsi convention

$ cat v1/acme_hub_full.dtsi

        status = "disabled";
    };
};
dtdiff - Why don't I just use 'diff'?

... and thus ends the long meander
Exercise for the advanced student

Is there a need to extend the tools and techniques from this section for use with overlays?
Takeaway

- There are many ways that a device tree can be changed between the original source and the Extended DT in Linux kernel memory.
- DT includes suggest a different mental model than for C language includes, when investigating.
- dtdiff is a powerful tool for investigating changes, but may hide important changes.
- In some cases diff is more useful than dtdiff.
.dtb -----.dts (from where?)

Where did that come from???
A common problem that dtdiff does not solve:

A property is defined (and re-defined) in multiple .dts and .dtsi files.

Which of the many source locations is the one that ends up in the .dtb?
.dtb <--- .dts (from where?)

current solution:

scan the cpp output, from bottom to top, for the cpp comment that provides the file name for the dts fragment of interest
.dtb <--- .dts (from where?)

current solution:

scan the cpp output, from bottom to top, for the cpp comment that provides the file name for the dts fragment of interest

cpp output is available at

${KBUILD_OUTPUT}/arch/${ARCH}/boot/dts/.XXX.dtb.dts.tmp
(for XXX.dtb)
.dtb <--- .dts (from where?)

current solution:

scan the cpp output, from bottom to top, for the cpp comment that provides the file name for the dts fragment of interest

cpp output is available at

${KBUILD_OUTPUT}/arch/${ARCH}/boot/dts/.XXX.dtb.dts.tmp

(for XXX.dtb)
.dtb <--- .dts (from where?)

current solution:

example, where does the value of 'status' come from for pm8941_coincell?

# 2 "/../arch/arm/boot/dts/qcom-pm8941.dtsi" 2
...
  pm8941_coincell: qcom,coincell@2800 {
    compatible = "qcom,pm8941-coincell";
    reg = <0x2800>;
    status = "disabled";
  }
...
# 4 "/../arch/arm/boot/dts/qcom-apq8074-dragonboard.dts" 2
...
&pm8941_coincell {
  status = "ok";
**.dtb <--- .dts** (from where?)

**Current solution:**

scan the cpp output, from bottom to top, …
for the dts fragment of interest

**Incomplete solution:**

- dtc `/include/` directive not processed before this file is created
- Intelligence required when searching. For example, multiple labels may be attached to the node of interest.
.dtb --- .dts (from where?)

possible future solution:

$ make XXX.dtb

=====>

dtc --annotate -O dts
   -o ${KBUILD_OUTPUT}/arch/${ARCH}/boot/dts/.XXX.annotate.dts.tmp
   ${KBUILD_OUTPUT}/arch/${ARCH}/boot/dts/.XXX.dtb.dts.tmp

Subject: [RFC PATCH v5 0/2]
  dtc: dts source location annotation
To: devicetree-compiler
Date: Wed, 30 Sep 2015
possible future solution: .XXX.annotate.dts.tmp
pm8941_coincell: qcom,coincell@2800 { /* /local/nobackup/src/git_linus/linux--4.2-rc5/arch/arm/boot/dts/qcom-apq8074-dragonboard.dts:70 */

Chapter 3

Debugging Boot Problems

Examples of what can go wrong while trying to:
  - create devices
  - register drivers
  - bind drivers to devices

I will provide
  - some examples of failures at various stages
  - tools and techniques to investigate
DT kernel boot - Reference

Frank Rowand's ELCE 2014 talk:
  devicetree:
  Kernel Internals and Practical Troubleshooting

http://elinux.org/ELC_Europe_2014_Presentations
My pseudocode conventions

Will obviously fail to compile
Will usually not show function arguments
Each level of indentation indicated either
  body of control statement (if, while, etc)
  entry into function listed on previous line
Double indentation indicates an intervening
level of function call is not shown
Will often leave out many details or fabricate
specific details in the interest of simplicity
extremely simplified boot

start_kernel()
   pr_notice("%s", linux_banner)
setup_arch()
   unflatten_device_tree()
pr_notice("Kernel command line: %s\n", ...)
init_IRQ()
...
time_init()
...
rest_init()
   kernel_thread(kernel_init, ...)
kernal_init()
do_initcalls()
      // device creation, driver binding
Takeaway

do_initcalls() is where

- devices are created
- drivers are registered
- drivers are bound to devices
Initcalls occur in this order:

```c
char *initcall_level_names[] = {
    "early",
    "core",
    "postcore",
    "arch",
    "subsys",
    "fs",
    "device",
    "late",
};
```
of_platform_populate(, NULL, ,)
    for each child of DT root node
        rc = of_platform_bus_create(child, matches, lookup, parent, true)
        if (node has no 'compatible' property)
            return
        auxdata = lookup[X], where:
            # lookup[X]->compatible matches node compatible property
            # lookup[X]->phys_addr matches node resource 0 start
        if (auxdata)
            bus_id = auxdata->name
            platform_data = auxdata->platform_data
            dev = of_platform_device_create_pdata(, bus_id, platform_data, )
            dev = of_device_alloc(np, bus_id, parent)
            dev->dev.bus = &platform_bus_type
            dev->dev.platform_data = platform_data
            of_device_add(dev)
        bus_probe_device()
            ret = bus_for_each_drv(,, __device_attach)
            error = __device_attach()
            if (!driver_match_device()) return 0
            return driver_probe_device()
        if (node 'compatible' property != "simple-bus")
            return 0
        for_each_child_of_node(bus, child)
            rc = of_platform_bus_create()
            if (rc) break
        if (rc) break
initcall - of_platform_populate()

of_platform_populate(, NULL, , , ) /* lookup is NULL */
for each child of DT root node
rc = of_platform_bus_create(child, )
if (node has no 'compatible' property)
    return

<< create platform device for node >>
<< try to bind a driver to device >>

if (node 'compatible' property != "simple-bus")
    return 0
for_each_child_of_node(bus, child)
    rc = of_platform_bus_create(child, )
    if (rc) break
if (rc) break
auxdata = lookup[X], with matches:
    lookup[X]->compatible == node 'compatible' property
    lookup[X]->phys_addr == node resource 0 start
if (auxdata)
    bus_id = auxdata->name
    platform_data = auxdata->platform_data
dev = of_platform_device_create_pdata(
    bus_id,
    platform_data,
)
dev = of_device_alloc(
    bus_id,
)
dev->dev.bus = &platform_bus_type
dev->dev.platform_data = platform_data
of_device_add(dev)
    bus_probe_device(
        ret = bus_for_each_drv(
            __device_attach),
        error = __device_attach()
        if (!driver_match_device())
            return 0
        return driver_probe_device()
initcall - of_platform_populate()

platform device created for
- children of root node
- recursively for deeper nodes if 'compatible'
  property == "simple-bus"

platform device not created if
- node has no 'compatible' property
Drivers may be bound to the devices during platform device creation if

- the driver called platform_driver_register()
  from a core_initcall() or a postcore_initcall()

- the driver called platform_driver_register()
  from an arch_initcall() that was called before of_platform_populate()
Creating other devices

Devices that are not platform devices were not created by of_platform_populate().

These devices are typically non-discoverable devices sitting on more remote busses. For example:

- i2c
- SoC specific busses
Creating other devices

Devices that are not platform devices were not created by `of_platform_populate()`.

These devices are typically created by the bus driver probe function.
Non-platform devices

When a bus controller driver probe function creates the devices on its bus, the device creation will result in the device probe function being called if the device driver has already been registered.

Note the potential interleaving between device creation and driver binding.
When does driver attempt to bind to device?

- When the driver is registered
  ---- if the device already exists

- When the device is created
  ---- if the driver is already registered

- If deferred on the first attempt, then again later.
Chapter 3.1

Debugging Boot Problems

Examples of what can go wrong while trying to:

- create devices
- register drivers
- bind driver to device
Another new tool

What is this tool?
Where do I get it?
dt_node_info - What is this tool?

/proc/device-tree and /sys/devices provide visibility into the state and data of
- Flattened Device Tree
- Expanded Device Tree
- Devices
dt_node_info - What is this tool?

/proc/device-tree and /sys/devices provide visibility into the state and data of
- Flattened Device Tree

- Devices

dt_stat script to probe this information to create various reports

dt_node_info packages the information from dt_stat in an easy to scan summary
dt_node_info - Where do I get it?

Work In Progress patch is at:

http://elinux.org/Device_Tree_frowand
http://elinux.org/images/a/a3/Dt_stat.patch

Dependency:

requires device tree information to be present in sysfs

Tested:

only on Linux 4.1-rc2, 4.2-rc5 dragonboard

Might work as early as Linux 3.17. Please let me know if it works for you on versions before 4.1.

Debugging Boot Problems

As promised many slides ago (before getting sidetracked with dt_node_info and dt_stat):

I will provide

- some examples of failures at various stages
- tools and techniques to investigate
Lather, Rinse, Repeat

example build / boot / test cycle

configure kernel
build kernel
build .dtb
create boot image
install boot image
boot kernel

For my example target system, the .dtb is placed in the boot image
Problem - device not created

$ dt_node_info coincell

===== devices

===== nodes
/soc/spmi@fc4cf000/pm8941@0/qcom,coincell@2800 qcom,

===== nodes bound to a driver

===== nodes with a device

===== nodes not bound to a driver
/soc/spmi@fc4cf000/pm8941@0/qcom,coincell@2800 qcom,

===== nodes without a device
/soc/spmi@fc4cf000/pm8941@0/qcom,coincell@2800 qcom,
Look at Expanded DT

Are there any errors in the source .dts?

1) copy /proc/device-tree from target system to base/ on host system

2) decompile base/

$ dtdiff base
pm8941@0 {
    #address-cells = <0x1>;
    #size-cells = <0x0>;
    compatible = "qcom,spmi-pmic";
    reg = <0x0 0x0>;

    qcom,coincell@2800 {
        compatible = "qcom,pm8941-coincell";
        qcom,charge-enable;
        qcom,rset-ohms = <0x834>;
        qcom,vset-millivolts = <0xbb8>;
        reg = <0x2800>;
        status = "disabled";
        stratus = "ok";
    }
};
Look at Expanded DT

qcom,coincell@28000 {
    compatible = "qcom,pm8941-coincell";
    qcom,charge-enable;
    qcom,rset-ohms = <0x834>;
    qcom,vset-millivolts = <0xbb8>;

Chapter 3.2

Debugging Boot Problems

What can go wrong while trying to:

- create devices
- register drivers
- bind drivers to devices
platform_driver_register()
  driver_register()
  while (dev = iterate over devices on the platform_bus)
    if (!driver_match_device()) return 0
    if (dev->driver) return 0
    driver_probe_device()
    really_probe(dev, drv)
    ret = pinctrl_bind_pins(dev)
    if (ret)
      goto probe_failed
    if (dev->bus->probe)
      ret = dev->bus->probe(dev)
      if (ret) goto probe_failed
    else if (drv->probe)
      ret = drv->probe(dev)
      if (ret) goto probe_failed
    driver_bound(dev)
    driver_deferred_probe_trigger()
  if (dev->bus)
    blocking_notifier_call_chain()
initcall - // driver binding

Reformatting the previous slide to make it more readable (see next slide)
platform_driver_register()
  while (dev = iterate over devices on platform_bus)
    if (!driver_match_device()) return 0
    if (dev->driver) return 0
  driver_probe_device()
  really_probe(dev, drv)
    ret = pinctrl_bind_pins(dev)
    if (ret)
      goto probe_failed
    if (dev->bus->probe)
      ret = dev->bus->probe(dev)
      if (ret) goto probe_failed
    else if (drv->probe)
      ret = drv->probe(dev)
      if (ret) goto probe_failed
  driver_bound(dev)
  driver_deferred_probe_trigger()
  if (...) blocking_notifier_call_chain()
Problem - driver not bound

Many possible problems may result in driver not binding to the device.

Will debug several problems...
Problem - driver not bound (1)

$ dt_node_info coincell

/sys/devices/platform/soc/fc4cf000.spmi/spmi-0/0-00/

Output from dt_node_info truncated on the right.

Most slides showing dt_node_info output will be truncated in this manner.
Problem - driver not bound (1)

Was the driver configured into the kernel?

Device tree node in the .dts file:

```c
pm8941_coincell: qcom,coincell@2800 {
    compatible = "qcom,pm8941-coincell";
    reg = <0x2800>;
    status = "disabled";
};
```

Search for compatible = "qcom,pm8941-coincell" in the kernel source
Problem - driver not bound (1)

Search for compatible = "qcom,pm8941-coincell" in the kernel source

$ git grep "qcom,pm8941-coincell"

arch/arm/boot/dts/qcom-pm8941.dtsi:                     compatible = "qcom,pm894
drivers/misc/qcom-coincell.c:   { .compatible = "qcom,pm8941-coincell", },
drivers/misc/qcom-coincell.c:   .name = "qcom,pm8941-coincell"
(END)

driver is drivers/misc/qcom-coincell.c

Search drivers/misc/Miscfile for the config option to compile the driver
Search for the config option to compile the driver.

$ grep qcom-coincell drivers/misc/Makefile
obj-$(CONFIG_QCOM_COINCELL) += qcom-coincell.o
Problem - driver not bound (1)

Search for the config option to compile the driver. Is it enabled?

$ grep qcom-coincell drivers/misc/Makefile
  obj-$(CONFIG_QCOM_COINCELL) += qcom-coincell.o

$ grep CONFIG_QCOM_COINCELL ${KBUILD_OUTPUT}/.config
  # CONFIG_QCOM_COINCELL is not set
Problem - driver not bound (1)

FIX and try again

Enable config option for the driver

$ grep CONFIG_QCOM_COINCELL ${KBUILD_OUTPUT}/.config
CONFIG_QCOM_COINCELL=y
Lather, Rinse, Repeat

configure kernel
build kernel
build .dtb
create boot image
install boot image
boot kernel
Sidetrack

Q. Why is there no tool to generate a list of config options required by a device tree?

A. There have been attempts...
   It is not trivial to totally automate.
Sidetrack

===== nodes not bound to a driver
/soc/spmi@fc4cf000/pm8941@0/qcom,coincell@2800 qcom,

===== nodes without a device
Problem - driver not bound (3)

Was the driver probe successful at boot?

Kernel command line:
    dyndbg="func bus_add_driver +p"
    dyndbg="func really_probe +p"
Lather, Rinse, Repeat

configure kernel
build kernel
build .dtb
create boot image*
install boot image
boot kernel

*if kernel command line baked into boot image
Problem - driver not bound (3)

Was the driver probe successful at boot?

----- Target system -----

$ dmesg | grep coin
bus: 'platform': add driver qcom,pm8941-coincell
bus: 'platform': really_probe: probing driver qcom,pm8941-coincell
  with device fc4cf000.spmi:pm8941@0:qcom,coincell@2800
qcom,pm8941-coincell: probe of fc4cf000.spmi:pm8941@0:qcom,coincell@2800 failed with error -22
Problem - driver not bound (3)

qcom.pm8941-coincell: probe of ... failed with error -22

include/uapi/asm-generic/errno-base.h:

    #define EINVAL          22      /* Invalid argument */

$ grep EINVAL drivers/misc/qcom-coincell.c
    return -EINVAL;
    return -EINVAL;
    return -EINVAL;

Problem - driver not bound (3)

$ grep EINVAL drivers/misc/qcom-coincell.c
  return -EINVAL;
  return -EINVAL;
  return -EINVAL;

Debug strategy (1):
  Add printk() for each EINVAL return.
Problem - driver not bound (3) skip

Debug strategy (1):
Add printk() for each EINVAL return.

There are some alternatives to printk(), eg:
- read the C source, follow all possible paths returning error values, examine the decompiled EDT to see if missing or existing properties would trigger the error
- trace_printk()  
- kernel debugger breakpoint
- kernel debugger tracepoint

To keep the slides concise, I will only use printk().
Lather, Rinse, Repeat

configure kernel
build kernel
build .dtb
create boot image
install boot image
boot kernel
Problem - driver not bound (3)

Debug strategy (1):
   Add printk() for each EINVAL return.

Result:
   None of the printk() occur.
Problem - driver not bound (3)

qcom_coincell_probe() calls several other functions which may return errors. The common pattern is:

```c
rc = xxx();
if (rc)
    return rc;
```

**Debug strategy (2):**
Add printk() for each rc return.
Lather, Rinse, Repeat

configure kernel
build kernel
build .dtb
create boot image
install boot image
boot kernel
Problem - driver not bound (3)

Debug strategy (2):
  Add printk() for each rc return.

Result:
The error is returned from:

```c
rc = of_property_read_u32(node,
                          "qcom,rset-ohms",
                          &rset);
```
EINVAL is many call levels deep

This type of error is hard to find by reading source

```c
of_property_read_u32()
of_property_read_u32_array()
val = of_find_property_value_of_size()
*prop = of_find_property()
if (!prop):
    return ERR_PTR(-EINVAL)
if (IS_ERR(val))
    return PTR_ERR(val)
```
Problem - driver not bound (3)

NOT A FIX - show how to improve the error message before fixing

Add precise error message to driver:

```c
rc = of_property_read_u32(node, "qcom,rset-ohms", &rset);
if (rc) {
    dev_err(chgr->dev, "can't find 'qcom,rset-ohms' in DT block");
    return rc;
}
```

Lather, Rinse, Repeat

configure kernel
build kernel
build .dtb
create boot image
install boot image
boot kernel
Problem - driver not bound (4)

Showing the real error message!

$ dmesg | grep coin

... qcom,pm8941-coincell
   fc4cf000.spmi:pm8941@0:qcom,coincell@2800: can't find 'qcom,rset-ohms' in DT block
qcom,pm8941-coincell:
   probe of fc4cf000.spmi:pm8941@0:qcom,coincell@ failed with error -22
Problem - driver not bound (4)

can't find 'qcom,rset-ohms' in DT block

failed with error -22

The detailed message provides enough information to easily troubleshoot the problem.
The dev_err() error report is present in the real driver.

For the example, I removed the dev_err() to show how important it is to clearly report errors that result in the probe failing.
Problem - driver not bound (4)

FIX and try again

Add property 'qcom,rset-ohms' to the pm8941_coincell device tree node.
Lather, Rinse, Repeat

- configure kernel
- build kernel
- build .dtb
- create boot image
- install boot image
- boot kernel
FIXED - driver bound to device

$ dt_node_info coincell
===== devices
/sys/devices/platform/soc/fc4cf000.spmi/spmi-0/0-00/

===== nodes not bound to a driver

===== nodes without a device
Lather, Rinse, Repeat

configure kernel
build kernel
build .dtb
create boot image
install boot image
boot kernel

occurred 9 times in the “Debugging Boot Problems” examples
Lather, Rinse, Repeat

configure kernel
build kernel
build .dtb
create boot image*
install boot image
boot kernel

*On some systems, create boot image for a new .dtc is replaced by:

copy .dtc to bootloader
Lather, Rinse, Repeat

The tools and methods I showed are reactive.

The debug process might be improved by static analysis tools.

Currently being discussed and developed.
More useful data: driver

What bus was the driver registered for?

-----  Target system  -----  

Kernel command line:
   dyndbg="func bus_add_driver +p"

$ dmesg | grep "add driver"
bus: 'XXX': add driver ZZZ

Examples of bus type on next slide
More useful data: driver

$ dmesg | grep "add driver"
bus: 'platform': add driver gcc-msm8974
bus: 'i2c': add driver dummy
bus: 'mdio_bus': add driver Generic PHY
bus: 'usb': add driver hub
bus: 'qcom_smd': add driver wcnss_ctrl
bus: 'spmi': add driver pmic-spmi
bus: 'scsi': add driver sd
bus: 'spi': add driver m25p80
bus: 'mmc': add driver mmcblk
bus: 'amba': add driver mmci-pl18x
bus: 'hid': add driver hid-generic
More useful data: driver

Deferred probe issues

-----  Target system  -----  

Kernel command line:
  dyndbg="func deferred_probe_work_func +p"
  dyndbg="func driver_deferred_probe_add +p"
  dyndbg="func driver_deferred_probe_add +p"
  dyndbg="func driver_deferred_probe_del +p"
Typical driver binding patterns

Make these substitutions on the following slides

BUS --- the bus name
DEV --- the device name
DVR --- the driver name
Device Creation ---> probe

create child: NODE
device: 'DEV': device_add
bus: 'BUS': driver_probe_device: matched device DEV with driver DVR
bus: 'BUS': really_probe: probing driver DVR with device DEV

====== messages from driver probe function ======
driver: 'DVR': driver_bound: bound to device 'DEV'
bus: 'BUS': really_probe: bound device DEV to driver DVR
Driver Register ---> probe

bus: 'BUS': add driver DVR
bus: 'BUS': driver_probe_device: matched device DEV with driver DVR
bus: 'BUS': really_probe: probing driver DVR with device DEV

====== messages from driver probe function ======

driver: 'DVR': driver_bound: bound to device 'DEV'
bus: 'BUS': really_probe: bound device DEV to driver DVR
Deferred Probe ---> re-probe  skip

bus: 'BUS': add driver DVR
device: 'DEV': device_add
bus: 'BUS': driver_probe_device: matched device DEV with DVR
bus: 'BUS': really_probe: probing driver DVR with device DEV

===== messages from driver probe function =====
BUS DEV: Driver DVR requests probe deferral
BUS DEV: Added to deferred list
BUS DEV: Retrying from deferred list
bus: 'BUS': driver_probe_device: matched DEV with driver DVR
bus: 'BUS': really_probe: probing driver DVR with device DEV

===== messages from driver probe function =====
driver: 'DVR': driver_bound: bound to device 'DEV'
bus: 'BUS': really_probe: bound device DEV to driver DVR
Useful data: device and driver

Summary:

```

dyndbg="func really_probe +p"
dyndbg="func driver_bound +p"
dyndbg="func deferred_probe_work_func +p"
dyndbg="func driver_deferred_probe_add +p"
dyndbg="func driver_deferred Probe_del +p"
```
Takeaway

/proc/device-tree and /sys/devices provide visibility into the state and data of
- Device Tree
- Devices
- Drivers
Takeaway

/proc/device-tree and /sys/devices provide visibility into the state and data of
- Device Tree
- Devices
- Drivers

**dt_stat** combines this information to provide several reports

**dt_node_info** packages the information from dt_stat in an easy to scan summary
Takeaway

`kernel command line dyndbg` options can provide a lot of information about what is causing device creation and driver binding errors.
Takeaway

Driver authors: if enough information is provided in error messages then DT source errors should be solvable without reading the driver source.
Review

Comparing device trees through the life cycle
- (skipped if short on time)
- transformations during build, boot loader, kernel boot, run-time
- dtdiff (patches required)

Kernel boot: device creation, driver binding
- dyndbg
- dt_stat
- dtdiff
Review - Why this talk?

At the end of this talk, you will know how to:

- debug some common device tree problems
- access data to support the debug process

Debugging some types of device tree problems will be easier.
THE END
